

### DEPARTMENT OF PLANNING AND BUILDING

Promoting the wise use of land - Helping to build great communities

DATE: FEBRUARY 26, 2015

TO: PLANNING COMMISSION

FROM: JAMES CARUSO, SENIOR PLANNER

SUBJECT: CONTINUED HEARING to consider a request by the COUNTY OF SAN

**LUIS OBISPO** to amend portions of the following documents in order to encourage the development of certain renewable energy projects in the most suitable locations in unincorporated inland areas of the county through a Renewable Energy Streamlining Program (RESP): 1) Framework for Planning (Inland), Part I of the Land Use and Circulations Elements (LUCE) of the County General Plan; 2) the Carrizo, North County, San Luis Obispo, and South County Area Plans, Part II of the LUCE; 3) the Official Maps, Part IV of the LUCE; 4) the Conservation and Open Space Element of the County General Plan; 5) the Land Use Ordinance, Title 22 of the County Code; and 6) the Rules of Procedure to Implement the California

Land Conservation Act of 1965. (LRP2014-00015)

#### **RECOMMENDATION**

Recommend to the Board of Supervisors approval of General Plan Amendment and Ordinance Amendment LRP2014-00015 as shown in Exhibits LRP2014-00015:C, LRP2014-00015:D and LRP2014-00015:E based on the findings listed in Exhibits LRP2014-00015:A and LRP2014-00015:B.

#### **COMMISSION QUESTIONS**

1. How does the RESP 150 MW goal relate to the overall County RE goal in the COSE?

The Draft EIR at page 2.0-20 states, "As part of the County's comprehensive greenhouse gas reduction program directed by the Conservation and Open Space Element, the County EnergyWise Plan includes a goal to increase the production of renewable energy from small- and commercial-scale energy installations to account for **10 percent** of total local energy by 2020. Information

from PG&E was used to calculate the county's total load and the 10% to come from renewable energy sources by 2025. The result was 92 MW of renewable power (not including the utility scale projects)." In addition to the forecast load another 32 MW of rooftop solar is forecasted by the state. This 124 MW total was increased in the EIR to 150 MW in order to provide for a conservative CEQA analysis.

Note that the 150 MW capacity identified in the EIR is a build out scenario, not a goal. The 150 MW is used as an element of the EIR project to focus the analysis.

# 2. How does the RE goal compare with SLO County's existing/projected energy demand?

As noted above, the RESP does not establish an RE goal. The 150 MW buildout for the RESP represents the total anticipated developed area to result from RESP implementation. The RESP supports the County's goal to increase the production of renewable energy from small- and commercial-scale energy installations to account for **10 percent** of total local energy by 2020 as established by the COSE.

The California Energy Commission's adopted forecasts show the county's total estimated demand in 2014 as approximately 1,987,650 MWH (or 920 MW). The RESP is estimated to result in more than 10% of local energy demand by 2024 because rooftop solar is included in the total of 150 MW or 16% of 2024 demand.

# 3. What volume of carbon emissions will be permanently offset by the RESP 150 MW goal?

GHG reductions from the RESP are analyzed but not quantified in the EIR. Page 3.7-19 of the EIR notes that additional analysis of GHG reductions are not analyzed because the RESP is consistent with the adopted EnergyWise Plan and COSE. The County's EnergyWise Plan calculated a reduction range of approximately 21,390 metric tons of carbon dioxide equivalent (MTCO<sub>2</sub>e) to 57,920 MTCO<sub>2</sub>e by 2035 for achieving 10% of the local energy from renewable sources. Therefore, the EIR does not present further quantitative analysis of GHG reductions (or mitigations) to be achieved through the project. However, while GHG emissions reductions are not shown in the EIR, the project is anticipated to achieve reductions in GHG emissions by offsetting electricity from traditional sources with cleaner forms of energy production.

The COSE and EnergyWise plan are available at the Department's website.

EnergyWise Plan: <a href="http://www.slocounty.ca.gov/planning/CAP.htm">http://www.slocounty.ca.gov/planning/CAP.htm</a>

Conservation Element:

http://www.slocounty.ca.gov/planning/General Plan Ordinances and Element s/Elements.htm

## 4. How does the RESP carbon offset compare with that of Topaz and Sun Power combined?

The RESP and RESP EIR do not present estimates of carbon offsets. Although not quantified in the EIR, the project will result in anticipated reductions in GHG emissions based on an expansion in renewable energy supplies (see above). With expanded renewable energy supplies, demand for energy from traditional electricity sources decreases.

This results in a reduction in GHG emissions, as demand for higher-polluting electricity sources drops in response to a growing supply of renewable sources for electricity. Renewable sources for electricity can reduce carbon dioxide, in addition to other GHGs such as methane and nitrous oxide.

Unlike the GHG reductions expected with the RESP, carbon offsets are more permanent methods to permanently remove GHGs from the atmosphere. Offset projects typically follow strict protocols to ensure ongoing, verifiable, and permanent reductions in GHGs. For instance, the California Air Resources Board administers protocols for sequestration for purposes of Cap-and-Trade program credits. In contrast, while the RESP would expand renewable energy and reduce GHG emissions, these reductions will vary year to year based on varying levels of energy production and changing levels of energy demand.

For comparison purposes, Table 1 compares the project-level GHG emissions reductions of Topaz and Sunpower. Note that the RESP is different than these projects because it presents a programmatic, countywide buildout potential. The County may or may not achieve the buildout potential of the RESP.

In comparison, Topaz and Sunpower present estimated reductions from actual energy projects, with estimates based on the characteristics of the specific facilities. Note that the GHG emissions reductions shown for Topaz and Sunpower are life-of-project emissions amortized over the lifespan of the project into an annual MTCO<sub>2</sub>e reduction of GHG emissions. Unlike the projects that would be streamlined by the RESP, Topaz and Sunpower are both utility-scale projects.

Table 1
Comparison of Annual GHG Emissions Reductions from the RESP and
Utility-Scale Renewable Energy Projects in San Luis Obispo County

	RESP	Sunpower (California Valley Solar Ranch)*	Topaz
Annual GHG Emissions Reductions (MTCO <sub>2</sub> e)	21,390 -57,920	261,280	352,826
MW	150	250	550

Notes: From page 5-20 of the EnergyWise Plan, C.5-9 of the California Solar Ranch FEIR, and page C.5-10 of the Topaz FEIR.

# 5. How many RE projects of what size (acreage and MW) are anticipated to be facilitated by RESP?

The number of individual solar projects is unknown; however, the EIR project description states that 1500 acres of land will be needed for 150 MW of renewable energy production. The four small projects approved through Minor Use Permit process in the last 2 years (and discussed at the previous hearings) were in the 1.0 to 2.0 MW range. Table 2 identifies acreage of these four projects, system size (MW) and acres per MW. Providing for 150 MW with facilities that are 1.0 to 2.0 megawatts at a time will result in 75 to 150 projects sites (spread throughout the county).

Table 2
System/Site Sizes

Acres	System Size	Acres/MW
5.5	0.45 MW	12.22 ac/MW
14.8	1.5 MW	9.87 ac/MW
3.0	0.5 MW	6.0 ac/MW

	20.0	1.0 MW	20.0 ac/MW
Total/Ave	43.3 acres	3.45 MW	12.02 ac/MW

#### **Streamlining Process:**

# 6. What are the principal differences in processing RESP projects between Tiers 1, 2, 3, and 4?

All tiers must comply with the following standards in order to meet basic streamlining requirements:

- 1. Not sited on Prime Farmland (as defined in the COSE).
- 2. Not located in Recreation or Open Space category.
- 3. No located in an Airport Review combining designation.

In addition to these all inclusive standards, Tier 1 projects (20 acres or less) must meet the following standards:

- a. Is located on land that is graded, disturbed, or altered; consistent with definitions for "Development<sup>1</sup>," "Grading<sup>2</sup>," or "Site Disturbance<sup>3</sup>" in this Title, or
- Is located on land that was previously developed for industrial or commercial purposes and degraded or contaminated and then abandoned or underused.

Also, Tier 1 projects can be streamlined inside and outside of the RE combining designations.

To be streamlined in the RE combining designation, Tiers 2 and 3 must meet 1-3 above plus all of the following standards in Section 22.14.100.B (Applicability) and Section 22.14.100 E and F (Development Standards):

<sup>&</sup>lt;sup>1</sup> Any activity or alteration of the landscape, its terrain contour or vegetation, including the erection or alteration of buildings or structures. New development is any construction, or alteration of an existing structure or land use, or establishment of a land use after the effective date of this Title.

<sup>&</sup>lt;sup>2</sup> Any activity which involves the physical movement of earth material. This includes any excavating, filling, stockpiling, movement of material, compaction of soil, creation of borrow pits, or combination thereof, but does not include surface mining or quarrying operations (including the extraction and stockpiling of excavated products and the reclamation of mined lands) operating in conformance with Chapter 22.36 (Surface Mining and Reclamation). [Amended 1999, Ord. 2863]

<sup>3</sup> Any activity that involves clearing, grubbing, grading, or disturbances to the ground such as stockpiling or excavation. [Added 2010, Ord. 3188]

- 1. Do not include new offsite transmission or distribution lines
- 2. Not located in a visual Sensitive Resource Area
- 3. In addition to OS and REC land use categories outlined above, not in RSF, RMF or RS land use categories.
- 4. Not located on Important Agricultural Soils (except for land designated as solely Highly Productive Rangeland soils.
- 5. Complies with specific development standards (subsection F):
  - a. Must comply with other agencies' permits (Section F(1) Page 13)
  - b. Meets biological standards no presence of species or critical habitat (Section F(2) – Page 14)
  - c. Wildlife fencing (Section F(3) Page 14)
  - d. Habitat Assessment and setbacks (Section F(4) Page 14)
  - e. Setbacks from sensitive species and habitats (Section F(5) Page 14)
  - f. Meets archeological standard (Section F(7) Page 14-15)
  - g. Meets revegetation standard (Section F(8) Page 15)
  - h. Meets agriculture standard (Section F(9) Page 15-16
  - i. Meets screening requirements (Section F(10) Page 17)

These standards a-i are firm standards that must be met if a project is to be streamlined through Site Plan Review. A Minor Use Permit process may find other methods that attempt to accomplish the same results but that are not as inclusive, effective or straight forward.

# 7. In reference to "self-mitigation," what is meant by the reference to "strict performance standards?" What are some examples?

The standards in number 6 above reflect the "performance standards" that must be met by each tier in order for the project to be eligible for streamlined permitting. They are termed "performance standards" because the project must show how it conforms or performs compared to these standards. The LUO is a performance based ordinance and contains many performance standards (setbacks and height limits are simple performance standards) such as subdivision parcel sizes. Parcel sizes in various land use categories are determined through performance standards such as slope, distance from urban areas, emergency response times and road access.

The RESP continues the performance based character of the LUO. The "strict performance standards" are summarized in No 6 above and are straight forward. The standards 1-3 are:

- 1. Not sited on Prime Farmland (as defined in the COSE).
- 2. Not located in Recreation or Open Space category.
- 3. Not located in an Airport Review combining designation

Other strict performance standards include 5 a-i above such as the presence or absence of critical habitat and/or sensitive species; setbacks from streams and wetlands; and the archaeological, revegetation and agricultural standards.

## 8. How are potential cumulative impacts of multiple, clustered RE projects to be dealt with?

Cumulative impacts are a CEQA issue and are addressed in each chapter of the EIR. For purposes of land use, the Draft EIR finds impacts are less than cumulatively considerable due to new standards proposed to create buffers between land uses. Page 3.9-24 of the EIR notes:

"[Proposed] standards would "provide large buffers from residential uses, adjacent parcels, or wetlands with setbacks determined by the tier of renewable energy facility and the underlying land use category By avoiding and reducing environmental impacts for each parcel on which a SEF or WECS is proposed, the Program would also avoid or reduce cumulative impacts of renewable energy development in the county. The Program's land use and planning impacts are there less than cumulatively considerable."

As shown in this text, the RESP addresses potential cumulative impacts through project-by-project design standards. These standards protect both the site of the proposed projects and adjacent sites.

In another example, the Aesthetic section of the EIR concludes:

"Cumulative development sharing foreground and possibly middleground views of these facilities—as well as any associated glare, reflectivity, and lighting—may increase overall visual contrast and result in a cumulative change to the visual character of an area. The potential for such impacts would be greatest at viewsheds of surrounding undeveloped land where cumulative development results in long-term diminished scenic quality."

So, this EIR section concludes that many projects taken together have the potential to diminish long-term scenic quality. However, regardless of which permit process is followed, ministerial or discretionary, screening of some type

will be required. Section F(10) (see 3i above) requires screening of the facility from neighboring property and roadways.

## 9. What substantive differences in processing exist between a Site Plan Review and a Minor Use Permit?

The Site Plan review process is ministerial and MUPs are discretionary. This is the primary and fundamental difference between the two. And because of this difference, one is useful for permit streamlining purposes and one is not. It is vital to remember the purpose of the policy being implemented through the RESP is to streamline the permitting process for the class of projects (Tiers). The draft RESP presented to the Commission will implement this policy.

However, every step taken away from streamlining such as using a discretionary process, creating a public notice and hearing process and making compliance with standards that are already strict and difficult to accomplish yet even more strict work to defeat the purpose of the RESP.

# 10. Why is Site Plan Review preferred over the Minor Use Permit in the RESP process?

The Site Plan Review process is proposed as the permit streamlining vehicle for qualifying renewable energy projects. Site Plan Review is a ministerial process where a well-defined set of development (performance) standards must be met in order for the permit to be approved. However, once it is determined that the well-defined standards have been met, no further decision making is needed. This process provides the two aspects of permit streamlining: 1) more certainty in the time needed to get through the process; and 2) more certainty in the permit process result. The certainty in result is also of benefit to the public and other stakeholders. The standards to be met are transparent and the process does not allow for deviation from those standards.

Contrast this process with well-defined standards to a discretionary review process such as a Minor Use Permit or Conditional Use Permit. The MUP and CUP processes are more time intensive (almost open ended) and final results of the permit process are uncertain.

The LUO already provides for a Site Plan Review process that is used for many other land uses (see January 22, 2015 Supplemental staff report page 6-7). The Site Plan is appropriate for qualifying renewable energy projects as identified in the RESP and its use as such is consistent with the LUO and adopted County

policy direction in the COSE. The RESP is not amending the existing permit processing requirements.

# 11. How and when will RE Combining Designation maps which are definitive in relation to property boundaries become available for public inspection?

The County's Official Maps (Part IV of the Land Use Element) are digitized for ease of use by the public, staff and decision makers. All land use categories and combining designations appear of property information data bases such as "Geoview" and "PermitView". Land use categories and combining designations can also be found for every piece of property in the county through the public "Tidemark" permit tracking system.

An application is being prepared for the Department's web site that will show RE boundaries and parcel data. Using this application, properties in the RE can be identified on a map or in a property database using a street address or assessor parcel number. The application will be available for use by the end of February.

# 12. What, if any, notice protocol exists for making members of the public aware that they are in or near RE Combining Designation perimeters?

State law requires public hearings regarding general plan amendments and land use ordinance changes be advertised in newspapers of general circulation and notice sent to those who have requested such notice. In addition in this county, notice of the project hearings, availability of documents, staff reports and other information appear in the Department's web site and are regularly sent to organizations such as advisory committees and cities.

Once a change to the general plan, ordinance or official maps is approved by the Board of Supervisors, no further notice is given. This is the usual process with all ordinance amendments.

## 13. Of the 1500 acre RESP goal, how many acres would involve new land disturbance?

As explained above, the RESP does not establish a *goal* of 1,500 acres of solar development in the county. Rather, the acreage is a conservative estimate of the total disturbed land area that would result from the 150 MW anticipated with the RESP, and is used as an assumption for the analysis of cumulative impacts in the EIR.

# 14. Which provisions of RESP are mandated by AB 2188, the solar energy permit law?

The law known as Assembly Bill 2188 and chaptered at 65850.5 of the Government Code addresses local jurisdictions' permitting process for residential roof top solar. The law generally requires local jurisdictions have a timely and efficient process to permit small, roof top residential solar projects with an administrative, streamlined, process. Permitting requirements and documents need to be on line, one inspection is done for eligible projects and Homeowners Associations are limited in how long they can take to allow a roof top solar project. The County building process conforms to these requirements and the RESP does not address these issues.

15. What factors account for differences in process time needed for a Site Plan Review (less than 90 days per the February 5 Supplemental Staff Report) vs. a typical Minor Use Permit (4-9 months), e.g., Environmental Review, 300 foot property owner notice, planning director hearing? What percent of MUPs involve planning director hearings?

Site Plans and MUPs (CUPs too) follow similar steps early in the permitting processes. Once an application is submitted, the agency has 30 days to either accept the application as complete for processing or ask the applicant for additional information on the proposed project and/or site. Once an application is accepted, environmental or CEQA review can take place through preparation of an EIR, Initial Study with a Negative Declaration or Mitigated Negative Declaration, use of a document prepared for a previous project or an exemption from further environmental review for Site Plans, MUPs or CUPs.

At the beginning of the process, a large difference exists between the time it takes to accept a MUP application and a Site Plan application. A Site Plan has a set of very distinct requirements that must be reviewed through an established check list. If the application contains the information needed to analyze the project's consistency with the distinct requirements, the application is accepted for processing and then can go ahead to review for approval or under certain circumstances, CEQA review prior to action.

A discretionary permit application such as a MUP or CUP can go through multiple rounds of information requests and submittals as there is not one set of distinct standards for the project to meet. Instead, more information is usually required in order to accept the application as any issue of compatibility with surrounding development can be raised and addressed.

Additional time is also needed at the back of the permit process. A public hearing requires approximately 5 weeks of lead time from preparation of a notice to the date of the hearing. A Site Plan application can be acted upon directly upon completion of the appropriate CEQA process.

Lastly, the time difference is not the most important element in this streamlining concept. While the MUP process does take considerably longer than a Site Plan process, streamlining is emphasized with Site Plan by the certainty of the result. The project developer knows the exact project requirements from a reading of the ordinance. A discretionary permit process, by its very name, expects other issues to arise and be addressed.

The four smaller solar projects mentioned in these RESP staff reports all took a considerable amount of time to process to a conclusion.

Table 3
Permit Time

	Acres	System Size	Acres/MW	Time
	3.0	0.5 MW	6.0 ac/MW	11 months
	20.0	1.0 MW	20.0 ac/MW	13 months
	5.5	0.45 MW	12.22 ac/MW	16 months
	14.8	1.5 MW	9.87 ac/MW	17 months
Total/Ave	43.3 acres	3.45 MW	12.02 ac/MW	14.25 months

16. Under RESP are there any circumstances in which a Site Plan Review might be considered a "project" under CEQA, requiring Environmental Review? If so, would property owner notice be required since the process would be "discretionary?"

Site Plan review is defined in the LUO as a "ministerial permit" that generally is not subject to CEQA. However, the LUO acknowledges that some uses that qualify for Site Plan Review may have effects on the environment that need to be addressed. Site Plan review applications are subject to CEQA under certain circumstances. In the environmental determination process, the County decides the necessary level of environmental review for a project based on the guidance in LUO Sections 22.62.040.B and 22.62.050.B. LUO section 22.62.040 states that an environmental determination is required for a Site Plan Review application if a drainage plan is required due to site disturbance or grading is proposed.

Note that projects that qualify for Site Plan Review under the Program have already been evaluated under the provisions of CEQA in the RESP EIR and would only require a new CEQA document if the environmental determination process project triggers the need for either a drainage plan or a grading plan (LUO section 22.62.040), or does not meet all of the environmental performance standards required for eligibility.

17. Under which Title 22 performance standards would nuisance glare from solar arrays on nearby properties be mitigated, e.g., positioning to avoid excessive glare on residences?

LUO Section 22.32.050D(1) – Other Special Standards for SEFs (page 36 of 64) states:

"All SEFs shall use non-reflective surfaces that minimize glare to the greatest extent feasible."

This standard is similar to the conditions placed on all solar projects that go through the MUP process. The non-reflective standard must be met regardless of whether it is adopted as part of a MUP or Site Plan review process.

Further, Section 22.32.050.D(4) provides an additional standard for rotating solar projects to reduce glare (page 36 of 64):

"Rotating SEFs shall have tracking system design and shall not create concentrated reflections directed at occupied structures, recreation areas, Sensitive Resource Areas, or public roads."

Similar to the standard listed above, this standard applies whether a project is adopted with a MUP or Site Plan review.

18. How would the "notice of application" procedure suggested in the February 26 RESP staff report compare with the notice procedure required for a Minor Use Permit?

As suggested in the original February 26, 2015 staff report, your Commission has been concerned with notification of the neighbors of the projects that would potentially be streamlined as a result of the RESP. Staff offers the following language that requires applicants to send a letter to adjacent property owners and the local advisory committee detailing the project description and providing a contact name and number 10 days before the application submittal.

**Prior to application submittal**. The applicant shall submit evidence that the neighboring property owners and the applicable advisory group were notified of the request prior to the submission of the land use permit to the county. This

notice shall be provided by the applicant sending a letter using the form provided by the Department of Planning and Building. The letter shall be mailed or delivered at least 10 days prior to application submittal to the applicable advisory group and to all owners of abutting real property as shown on the latest equalized assessment roll.

#### Alternatives to the Proposed RESP

Currently, the RESP proposes to streamline Tiers 1, 2 and 3 solar electric facilities (SEFs) that allow development of up to 20 acres, 40 acres and 160 acres. The Commission has the option to revise (restrict) the tier sizes to acreages smaller than currently proposed or to only offer streamlining to Tiers 1 and 2. Streamlining just the first two tiers will reduce the opportunities for streamlining to projects under 40 acres as the tiers are currently defined. Tiers 3 and 4 could be merged into a single tier with a MUP permit requirement and no streamlining opportunity.

In lieu of adopting the tiers as defined, Tier 2 can be increased in acreage to offer streamlining to a greater range of projects as is anticipated in the policy.

Section 22.14.100e(2) on page 12 could be amended to read:

Tier 2 SEF. If a proposed SEF meets the following criteria and is 40 60 acres or less in total area of the facility within the RE Combining Designation, the project may be considered a Tier 2 SEF eligible for Site Plan Review.

Alternatively, Tier 2 can be redefined to another project size or include other characteristics.

13.0	Statement of Overriding Considerations	75

#### 1.0 Introduction

#### 1.1 Organization of CEQA Findings of Fact

The content and format of these Findings of Fact (Findings) are designed to meet the requirements of the California Environmental Quality Act (CEQA) and the State CEQA Guidelines. The Final Environmental Impact Report (EIR) for the Renewable Energy Streamlining Program (Program; RESP) identified significant environmental impacts that will result from implementation of the RESP. In accordance with CEQA and the CEQA Guidelines, the County adopts these Findings of Fact as part of the certification of the Final EIR for the proposed Program. Pursuant to Public Resources Code Section 21082.1(c)(3), the County of San Luis Obispo (County) also finds that the Final EIR reflects the County's independent judgment as the lead agency for the proposed project.

The Findings of Fact are organized into the following sections:

- **Section 1.0, Introduction**, outlines the organization of this document and identifies the location and custodian of the record of proceedings.
- **Section 2.0, Environmental Setting and Project Description**, describes the location and characteristics of the affected area, program overview, program objectives and benefits, and required permits and approvals for the program.
- Section 3.0, CEQA Review and Public Participation, describes the steps the County has undertaken to comply with the CEQA Guidelines as they relate to public input, review, and participation during the preparation of the EIR.
- **Section 4.0, Insignificant Effects,** provides a summary of those environmental issue areas that bear little relation to the proposed Program and effects were determined to be insignificant.
- **Section 5.0, Beneficial Impacts (Class IV)**, provides a summary of those environmental issue areas where beneficial effects will result.
- Section 6.0, Less Than Significant Environmental Impacts (Class III), provides a summary of insignificant impacts and a finding adopting the EIR's conclusions of insignificance.
- Section 7.0, Less Than Significant Environmental Impacts with Mitigation Incorporated (Class II), identifies that there are no Class II impacts identified in the EIR, as any measures deemed necessary to reduce or avoid an identified impact are proposed to be codified (i.e., included in the County's implementing land use ordinances) as required performance criteria for projects proposed under the Program.
- Section 8.0, Significant, Unavoidable, and Adverse Environmental Impacts (Class I), provides
  a summary of potentially significant environmental effects for which implementation of
  feasible mitigation measures will not avoid or substantially reduce the environmental effects
  to less than significant levels.
- Section 9.0, Feasibility of Project Alternatives, provides a summary of the alternatives considered for the proposed project.

- **Section 10.0, Long-Term Implications**, provides a summary of the analysis of any potential long-term implications of the proposed project.
- Section 11.0, Findings on Changes to the EIR and Recirculation, provides a brief overview of reasons for changes to the EIR and why it is not necessary to recirculate the EIR.
- Section 12.0, Findings on Mitigation Monitoring and Reporting Program, provides a brief discussion of the project's compliance with the CEQA Guidelines regarding the adoption of a plan for monitoring and reporting compliance with mitigation measures.
- **Section 13.0, Statement of Overriding Considerations**, provides a statement of the project benefits that outweigh the significant and unavoidable project impact.

#### 1.2 STATUTORY REQUIREMENTS

The California Environmental Quality Act (Public Resources Code Section 21081 et seq.), and particularly the CEQA Guidelines (the Guidelines) (14 California Code of Regulations, Section 15091 et seq.), require:

- (a) No public agency shall approve or carry out a project for which an EIR has been certified which identifies one or more significant environmental effects of the project unless the public agency makes one or more written findings for each of those significant effects, accompanied by a brief explanation of the rationale for each finding. The possible findings are:
  - 1. Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effect as identified in the final EIR.
  - 2. Such changes or alterations are within the responsibility and jurisdiction of another public agency and not the agency making the finding. Such changes have been adopted by such other agency or can and should be adopted by such other agency.
  - 3. Specific economic, legal, social, technological, or other considerations, including provision of employment opportunities for highly trained workers, make infeasible the mitigation measures or project alternatives identified in the final EIR.

In short, CEQA requires that the lead agency adopt mitigation measures or alternatives, where feasible, to avoid or mitigate significant environmental impacts that will otherwise occur with implementation of the proposed project. Project mitigation or alternatives are not required, however, where they are infeasible or where the responsibility for modifying the proposed project lies with another agency (CEQA Guidelines Section 15091(a), (b)).

For those significant effects that cannot be mitigated to a less than significant level, the public agency is required to find that specific overriding economic, legal, social, technological, or other benefits of the proposed project outweigh the significant effects on the environment (Public Resources Code Section 21081(b)). The CEQA Guidelines state in Section 15093: "If the specific economic, legal, social, technological, or other benefits...of a proposed project outweigh the unavoidable adverse environmental effects, the adverse environmental effects may be considered 'acceptable.'"

#### LOCATION AND CUSTODIAN OF RECORD OF PROCEEDINGS

For purposes of CEQA and these Findings of Fact, the record of proceedings for the proposed project consists of a number of documents and other evidence, including the Notice of Preparation and all other public notices issued by the County in conjunction with the proposed program; the Draft EIR, including all documents included and referenced in the appendices and in references in the Draft EIR; the Final EIR, including all documents included in the appendices and in references in the Final EIR; all written comments and public testimony presented during the public comment period on the Draft EIR; the findings and resolution adopted by the County relative to the certification of the Final EIR; the findings and resolutions adopted by the County in connection with the proposed program and all documents incorporated by reference therein; all final reports, studies, memoranda, maps, staff reports, County reports, and County information packets relating to the proposed project prepared by or at the direction of the County or responsible or trustee agencies with respect to the County's compliance with the requirements of CEQA or with respect to the County's actions on the proposed program; all documents submitted to the County by other public agencies or members of the public in connection with the proposed project; the minutes and/or verbatim transcripts of all information sessions, public meetings, and public hearings held by the County in connection with the proposed program; any documentary or other evidence submitted to or by the County at such information sessions, public meetings, and public hearings; and any documents cited in these Findings.

The documents and other materials that constitute the record of proceedings are located at 976 Osos Street, Room 200, San Luis Obispo, CA 93408. The County Planning and Building Department is the custodian of such documents and other materials that constitute the record of proceedings. The record of proceedings is provided in compliance with Public Resources Code Section 21081.6(a) (2) and California Code of Regulations Title 14, Section 15091(e).

#### 1.3 CERTIFICATION OF FINAL EIR

Pursuant to CEQA Guidelines Section 15090, the County further finds and certifies that:

- a) The Final EIR has been completed in compliance with CEQA.
- b) The Final EIR has been presented to the Board of Supervisors of San Luis Obispo County, which constitutes the decision-making body of the lead agency, and the Board has reviewed and considered the information contained in the Final EIR prior to approving the project.
- c) The Final EIR reflects the County's independent judgment and analysis.

#### 2.0 ENVIRONMENTAL SETTING AND PROJECT DESCRIPTION

#### 2.1 ENVIRONMENTAL SETTING

San Luis Obispo County is located along California's Central Coast. The county is bounded by the Pacific Ocean to the west, Monterey County to the north, Kern County to the east, and Santa Barbara County to the south. San Luis Obispo County encompasses a total area of 3,616 square miles. Of this total area, 3,304 square miles are land and 311 square miles are water. The county's coastline spans 96 miles.

San Luis Obispo County is physically diverse, ranging from beaches to mountains and valleys. The majority of land in the county is used for agriculture. Most of the county's remaining land is used for rural land uses and open space. Rural land uses are distributed throughout the county. In the county's central area, the southern portion consists of large open space areas. Urban land uses and incorporated cities comprise less than 10 percent of the county's land, including residential, public facility, recreation, commercial, office, or multi-use land uses.

The County has jurisdictional authority over unincorporated, non-federal lands. Of 2,124,248 total acres of land countywide, San Luis Obispo County operates jurisdictional control over 1,470,784 acres of unincorporated land. For purposes of the Program, the project area consists of unincorporated areas under County jurisdiction, exclusive of the Coastal Zone. Approximately 1,049,134 acres of unincorporated land is included in the Program.

#### 2.2 PROJECT DESCRIPTION

#### **Program Overview**

The County has prepared a Renewable Energy Streamlining Program (RESP) that is intended to encourage and streamline permitting of certain solar electric facilities (SEF) and wind energy conversion systems (WECS) in the most suitable locations in the unincorporated area of the county. This would be formalized through County ordinance revisions and associated updates to County policies. No specific renewable energy development projects are being proposed or approved as part of RESP adoption.

The Program includes a new Renewable Energy (RE) Combining Designation to identify the most suitable locations for renewable energy development. The existing Section 22.14.010 of the San Luis Obispo County Land Use Ordinance (LUO) defines a combining designation as:

Combining designations are used to identify and highlight areas of the county having natural or built features which are sensitive, hazardous, fragile, of cultural or educational value, or of economic value as extractable natural resources. The purpose of combining designation standards is to require project design that will give careful consideration to the land features, structures and activities identified by the combining designations. These standards provide for more detailed project review where necessary to support public safety or proper use of public resources.

The proposed RE Combining Designation was designed to encompass areas with access to renewable energy infrastructure (transmission and substations) while excluding areas that may result in land use conflicts or otherwise impact natural resources.

The Program also includes revisions to the County's General Plan, LUO, and Williamson Act Rules of Procedure to support siting, review, and permit streamlining of distributed generation renewable energy facilities, including rooftop solar and wind facilities, solar-covered parking lots, and small wind generators. The RESP focuses only on the inland area of the county and does not include the Coastal Zone.

#### **Renewable Energy Combining Designation and Standards**

Areas included in the proposed RE Combining Designation are those that are most conducive to streamlining permits for SEFs without any of the following resource issues or characteristics:

Location within a visual Sensitive Resource Area (SRA)

- Location within certain Highway Corridor Design Standard areas
- Areas covered by conservation easements
- Areas that have been or are intended for preservation for unique biological values
- Parcels in the Recreation (REC) and Open Space (OS) land use categories
- Any areas beyond a 10-mile distance from an existing substation
- Areas with Prime Farmland

The proposed RE Combining Designation identifies areas where renewable energy projects could occur, but not necessarily where they will occur. Provisions of the Program that regulate site characteristics, as well as the requirements of the LUO, will govern the potential for a project in a specific location to qualify for the Program. Section 22.14.100 of the proposed Land Use Ordinance identifies project eligibility characteristics and performance standards. For instance, Section 22.14.100.F requires that biological surveys be prepared and that the avoidance of sensitive species be documented or the project loses eligibility for streamlining.

#### **Revisions to Other Sections of the County LUO**

Chapter 22.32 (Electric Generating Facilities) will also be updated to provide development standards and performance criteria for renewable energy technologies proposed throughout the Program boundaries. These revisions include streamlined permit review for certain types of renewable energy facilities and foster greater clarity and transparency in the renewable energy entitlement process. New content in Chapter 22.32 would simplify and standardize the application and entitlement process for all SEFs and WECS countywide, both within and outside of the RE Combining Designation.

For instance, Chapter 22.32 would include new setbacks and development standards for ground-mounted WECS facilities. Updates to Chapter 22.32 and Article 8 would also provide greater certainty for other categories of renewable energy development and reduce barriers to permitting certain renewable energy technologies. The Program also includes changes to clarify the process to determine the level of discretionary permit requirements for renewable energy technologies.

Other ordinance and plan revisions include the following:

- Williamson Act Rules of Procedure: revisions to the allowed uses table to allow electricgenerating plants (electricity generation)
- Framework for Planning, Part of I of the Land Use and Circulation Element, as well as the Official Maps: amendments to establish and map the RE Combining Designation
- Article 9 and Article 10 of Title 22, Planning Area Standards and Community Planning Area Standards: revisions to remove prohibitions on electricity-generating uses that would otherwise fall within the RE Combining Designation
- Conservation and Open Space Element (COSE): updates to goals, policies, and glossary to ensure consistency of renewable energy definitions with new distributed generation and technology definitions in Title 22

#### **Summary of Program Streamlining**

The types of projects that would become eligible for permit streamlining as a result of the Program are summarized in the table below. Streamlined reviews and approvals would be achieved either through the building permit process, zoning clearance process, or site plan review process, as specified in the table.

#### PROJECTS ELIGIBLE FOR PERMIT STREAMLINING UNDER THE PROGRAM

Renewable Energy Project Class	Definition and Conditions	Permit Streamlining Afforded
Renewable energy-generating facility as an accessory use	<ul> <li>An accessory renewable energy-generating facility that meets the following criteria:</li> <li>Does not provide energy for sale to off-site uses.</li> <li>Is not within an area designated open space (OS) or recreation (REC)</li> <li>Is not within Flood Hazard or Sensitive Resource Area Combining Designation.</li> <li>Is a ground-mounted facility that is 3 acres or less in area (exclusive of the total parcel area).</li> <li>Is set back 100 feet or more from any adjacent property or public road.</li> <li>Is proposed on a parcel with an existing or apparent use or development</li> </ul>	Allowed by Zoning Clearance as described in Chapter 22.32.
	<ul><li>on the property.</li><li>Is not subject to environmentally related permits.</li></ul>	
Tier 1 SEF, roof- or structure- mounted	Located on the roof or structure of a conforming use.	Allowed with Zoning Clearance as described in Chapter 22.32.
Tier 1 SEF, ground-mounted	<ul> <li>A solar electric facility that is 20 acres or less and meets the following:</li> <li>Proposed on a parcel included in any land use category other than Residential Single Family (RSF), Residential Multi-Family (RMF), or Residential Suburban (RS).</li> <li>Is ground-mounted.</li> <li>Is located on land that is graded or disturbed (consistent with Title 22 definitions for "grading" and "site disturbance").</li> <li>Is located on land that was previously developed for industrial or commercial purposes and degraded or contaminated and then abandoned or underused.</li> <li>Is not located on Prime Farmland.</li> </ul>	Allowed with Site Plan review as described in Chapter 22.32.
Tier 1 WECS	A wind energy conversion system that is mounted on a roof or structure of a conforming use located in one of the following land use categories: Agriculture (AG); Rural Lands (RL); Residential, Rural (RR); Commercial, Service (CS); Industrial (IND); Open Space (OS); or Public Facilities (PF).	Allowed with Zoning Clearance as described in Chapter 22.32.

Renewable Energy Project Class	Definition and Conditions	Permit Streamlining Afforded	
Tier 2 SEF	A solar electric facility that is 40 acres or less in the Renewable Energy Combining Designation and meets the following:	Allowed by Site Plan review as described in Section 22.14.100.	
	<ul> <li>Proposed on a parcel included in any land use category other than Open Space (OS), Recreation (REC), Residential Single Family (RSF), Residential Multi-Family (RMF), or Residential Suburban (RS).</li> </ul>		
	In the Agriculture (AG) land use category, is not sited on any type of Important Agricultural Soils as defined in the Conservation and Open Space Element, unless sited on important Agricultural Soils that are designated solely as Highly Productive Rangeland Soils.		
Tier 3 SEF	A solar electric facility that is 160 acres or less in size in the Renewable Energy Combining Designation and meets the following:	Allowed by Site Plan review as described in Section 22.14.100.	
	Proposed on a parcel included in the Commercial, Service (CS), Industrial (IND), or Agriculture (AG) land use categories (vacant or non-vacant).		
	In the Agriculture (AG) land use category, is not sited on any type of Important Agricultural Soils as defined in the Conservation and Open Space Element, unless sited on important Agricultural Soils that are designated solely as Highly Productive Rangeland Soils.		
Renewable energy-generating facilities on land subject to Land Conservation Act contract (i.e., Williamson Act)	Renewable energy-generating facilities are allowed if they meet the following criteria:	Allowed by Site Plan review as described by Rules of Procedure Appendix E6.	
	Property must meet and maintain the current eligibility criteria in the Rules of Procedure.		
	The project area may not exceed 10 percent of total acreage within a land conservation contract.		
- 7	The project is no more than 10 acres in site area.		

#### 2.3 REQUIRED PERMITS AND APPROVALS

As lead agency, the San Luis Obispo County Board of Supervisors will consider adoption of the Program following certification of the EIR. Before adoption, the County is required to make specific findings of fact pursuant to State CEQA Guidelines Sections 15090, 15091, and 15093 regarding the significant environmental impacts of the project, the feasibility of measures to mitigate those impacts, and, if appropriate, a Statement of Overriding Considerations. The Board's action on the Program will be based on consideration of recommendations of the San Luis Obispo County Planning Commission.

To enact the Program, the County would adopt amendments to the following documents:

- Conservation and Open Space Element of the General Plan (Chapter 5 and Glossary)
- Land Use and Circulation Element Part I Framework for Planning (Inland) (Chapter 7)
- Land Use and Circulation Element Part II Area Plans
- Land Use and Circulation Element Part III The Official Maps
- Title 22, Land Use Ordinance (Articles 2, 3, 4, and 8)
- Land Use Permit Application Package
- Williamson Act Rules of Procedure

#### 3.0 CEQA REVIEW AND PUBLIC PARTICIPATION

In accordance with CEQA Guidelines Section 15082, the County prepared a Notice of Preparation (NOP) and distributed the NOP to the State Clearinghouse, responsible agencies, affected agencies, and other interested parties on April 23, 2014. Input provided during the 30-day NOP comment period regarding the scope of the environmental document is included as Appendix 1.0 in the Draft EIR. The NOP public review period began on April 23, 2014, and ended May 28, 2014. Two public scoping meeting sessions were held on April 30, 2014, at the County administration building's Board Chambers.

The Draft EIR, dated November 2014, was prepared following input from the public, responsible agencies, and affected agencies through the Draft EIR scoping process. The EIR was circulated to the responsible and affected agencies using the same distribution list beginning on November 17, 2014, and ending on January 2, 2015.

The County received 10 comment letters in response to the Draft EIR and prepared written responses to the comments that were included in the Final EIR.

#### 4.0 INSIGNIFICANT EFFECTS

Based on the Draft EIR, the Final EIR, and the whole of the record of proceedings, the County finds that the proposed Program will have no environmental impacts for the specific topic areas identified below. (Page numbers in parentheses refer to the Draft EIR, inclusive of revisions contained in the Final EIR, Chapter 3.0 Revisions to the Draft EIR.)

#### 4.1 POPULATION AND HOUSING (P. 3.12-1)

In terms of construction, Tier 3 solar electric facility (SEF) projects would average approximately 40 personnel, while Tier 1 and 2 SEF projects would average fewer personnel depending on the construction schedule and phasing. Construction of wind energy conversion systems (WECS) would require between three and five people per tower. For construction projects of this magnitude and duration, the workforce generally comprises workers that commute to job sites rather than relocate their household to any significant degree. As such, implementation of the Renewable Energy Streamlining Program (RESP; Program) is not anticipated to result in either an in-migration or a relocation of employees to satisfy the need for temporary construction-related employment. Therefore, no increase in temporary population would occur resulting from temporary workers relocating to the immediate area. Additionally, the RESP does not include a residential component that would directly induce new population growth. In fact, during construction of the SEFs and WECs associated with the implementation of the RESP, short-term employment could result in a beneficial impact on the local economy due to an increase in demand for products, services, and supplies found in the county.

#### 4.2 PUBLIC SERVICES (PP. 3.12-1 TO 3.12-2)

#### **Schools and Parks**

The RESP does not include the development of residential land uses that would result in an increase in population or student generation. Therefore, construction and operation of the SEFs and WECS facilities would not result in an increase in student population in any school district that would serve the project sites. As such, the proposed projects would have no impact on San Luis Obispo County schools. Similarly, without an increase in population, existing park facilities

would serve the project sites, and the Program would not require additional parks or recreational facilities.

#### **Police and Fire Protection**

In addition to the solar electric systems, SEFs can include additional on-site facilities such as electrical substations, while WECS include but are not limited to wind turbines, mounting posts, on-site transmission lines, operations and maintenance buildings, and other accessory structures. However, the projects approved in association with the RESP would require minimal construction and operational staff. As such, adequate police and fire protection services currently exist to serve future sites; therefore, the Program would not result in the need for additional police and fire personnel or facilities.

#### Wastewater

SEFs and WECS under the Renewable Energy Streamlining Program would generate minimal volume of wastewater during construction and operational phases. Wastewater generated by the operations and maintenance buildings associated with WECS would be minimal and could be treated via on-site septic systems. As a result, SEFs and WECS would not exceed the wastewater treatment requirements of the Central Coast Regional Water Quality Control Board. Additionally, neither the SEFs nor the WECS are anticipated to require new storm drainage facilities because the facilities approved for construction would not generate a significant amount of runoff water during operations. Water from the SEF panels would continue to percolate through the ground, as the majority of surfaces associated with larger SEF projects would remain pervious.

#### **Solid Waste**

Waste generation during construction and operation associated with the SEFs and WECS would be minor. Solid waste will be disposed of using locally licensed waste hauling services. The San Luis Obispo Integrated Waste Management Authority operates three landfills in the county: Cold Canyon Landfill, Chicago Grade Landfill, and Paso Robles Landfill. Based on the capacity at these landfills, there is ample capacity throughout the county to receive the minor amount of solid waste generated by SEF and WECS projects. Additionally, during decommissioning, much of the solid material (e.g., concrete and masonry, steel, reflecting mirrors, power cable, pipes, pumps) of the SEF and WECS facilities could be recycled and sold as scrap or used in road building or bank restabilization projects; the remaining nonhazardous waste would be sent to permitted disposal facilities. As such, SEF and WECS facilities would comply with waste reduction and recycling requirements.

#### 4.3 Transportation and Traffic (p. 3.12-3)

Implementation of SEFs and WECS would require a variety of transportation activities over the life of a project. Most of these transportation activities would involve the movement of workers, materials, and equipment to the specific development project site during the construction phase. The types and amounts of materials and equipment would depend on the technology type as well as site-specific characteristics. Construction of renewable energy projects would result in temporary increases in traffic trips on local roads and highways in the vicinity of a proposed renewable energy project site. Construction-related traffic would include worker vehicles and trucks delivering materials and supplies to the specific renewable energy project site. Construction of SEF and WECS facilities would vary in size; however, the size and magnitude projects permitted under the RESP would not result significant impacts on local roadways.

Ongoing operations and maintenance of SEF and WECS facilities would require worker commutes and deliveries of supplies. Accordingly, transportation activities during operations would be limited to a small number of trips by personal vehicles and a few truck shipments. Given the small number of traffic trips generated by operations of solar energy projects, the associated negligible increase in trips on local roadways and highways would not adversely impact the local transportation system or otherwise degrade level of service operations.

#### 5.0 BENEFICIAL EFFECTS (CLASS IV)

Based on the Draft EIR, the Final EIR, and the whole of the record of proceedings, the County finds that the proposed program will result in beneficial effects for the topic areas identified below.

#### 5.1 Greenhouse Gases and Climate Change

## Generate Greenhouse Gas Emissions That Exceed Thresholds as Established by the County Air Pollution Control District – Policy Changes (p. 3.7-18)

The implementation of the proposed policy changes to the General Plan would enable streamlined reviews and approvals of SEF and WECS facility projects to be achieved either through the building permit process, zoning clearance process, or site plan review process. These facilities produce emissions-free energy and by their nature do not produce air pollutant emissions. Instead they reduce emissions by decreasing the need for energy from fossil fuel-based power plants, which is considered a beneficial impact regionally and statewide. As shown in Table 3.7-5 of the Draft EIR, predicted mitigated construction-generated emissions would not exceed San Luis Obispo County Air Pollution Control District (SLOAPCD) significance thresholds. When compared to nonrenewable energy plants, the greenhouse gas (GHG) emissions reduction realized by of the use of the potential SEF and WECS facilities allowed by the proposed Program would more than offset the GHG emissions generated by their construction and ongoing operations.

## Conflict with Any Applicable Plan, Policy, or Regulation of an Agency Adopted for the Purpose of Reducing the Emissions of Greenhouse Gases – Solar/Wind (p. 3.7-19)

The County's EnergyWise Plan identifies how the County will achieve the GHG emissions reduction target of 15 percent below baseline levels by the year 2020 in addition to other energy efficiency, water conservation, and air quality goals. Specifically, the County's EnergyWise Plan's renewable energy goal is to increase the production of renewable energy from small- and commercial-scale energy installations to account for 10 percent of total local energy by 2020, which as stated in Draft EIR Section 2.0, Project Description, is precisely one of the stated objectives of the proposed Program. Since the RESP proposes to directly implement the EnergyWise Plan's renewable energy goal, it would not conflict with the County EnergyWise Plan.

## Conflict with Any Applicable Plan, Policy, or Regulation of an Agency Adopted for the Purpose of Reducing the Emissions of Greenhouse Gases – Policy Changes (p. 3.7-19)

As stated above, the County's EnergyWise Plan's renewable energy goal is to increase the production of renewable energy from small- and commercial-scale energy installations to account for 10 percent of total local energy by 2020, which as stated in Draft EIR Section 2.0, Project Description, is precisely one of the stated objectives of the proposed Program. Since the changes to countywide policies would fulfill the EnergyWise Plan renewable energy goal, it would not conflict with the County's EnergyWise Plan.

#### 6.0 Less Than Significant Environmental Impacts (Class III)

Based on the Draft EIR, the Final EIR, and the whole of the record of proceedings, the County finds that the proposed Program will result in less than significant impacts with respect to the topic areas identified below. Page numbers in parentheses refer to the Draft EIR unless otherwise noted.

#### 6.1 Aesthetics and Visual Resources

#### Have a Substantial Adverse Effect on a Scenic View – Construction (p. 3.1-15)

During construction of ground-mounted SEF projects (Tier 1, 2, or 3), the presence of construction equipment would introduce temporary visual contrast for foreground and near-middleground views. Ground clearing and numerous vehicles/equipment are required to deliver and install the arrays, resulting in movement, dust, and the presence of construction equipment. Temporary structures associated with construction are located within the work site for component assembly and finishing and for project site offices. Since visual impacts from the presence of construction equipment and vehicles are short term, associated impacts are considered less than significant.

#### Have a Substantial Adverse Effect on a Scenic View – Wind (pp. 3.1-16 through -17)

As discussed and analyzed in the EIR, streamlining of wind projects under the Program would be limited to Tier 1 WECS, which only includes installations mounted on a roof of a structure or conforming use. This scale of wind energy project would not be highly visible because of relatively short vertical tower mounts, small nacelle motors, and short blade lengths. However, to minimize any potential visual impacts, proposed County Code Section 22.32.060.C specifies height limitations of Tier 1 wind energy installations as 10 feet for agricultural, rural, and public facilities and 5 feet for all other land uses. When compared to the overall height and massing of the conforming structure upon which such turbines would be installed, these height standards minimize visual contrast from adjacent viewsheds. Additionally, proposed County Code Section 22.32.060.D.7 requires all wind turbine surfaces to be an unobtrusive color. Adherence to these and all County Code Title 22 requirements ensures Tier 1 WECS projects would result in less than significant (Class III) impacts with respect to creating aesthetically incompatible sites open to public view.

## Damage Scenic Resources, Including, but Not Limited to, Trees, Rock Outcroppings, and Historic Buildings Within a Designated Scenic Area – Solar (pp. 3.1-17 through -18)

The RE Combining Designation areas exclude streamlining renewable energy facilities in County-designated visual SRAs; certain Highway Corridor Design Standard areas, including scenic highway corridors; areas covered by conservation easements; and parcels in the Open Space land use category. Since these designated scenic areas are excluded from the Program, no renewable energy facilities would be sited in these areas as a result of the RESP. Additionally, all ground-mounted SEFs would be subject to a Site Plan Review (County Code Section 22.62.040), as well as height limitations to minimize line-of-sight intrusions into any adjacent scenic viewsheds (proposed County Code Section 22.32.050.C). Furthermore, when siting all SEFs, LUO Section 22.32.040.C.4 requires that they not be located in areas containing scenic geologic resources, such as exposed bedrock or rock outcroppings, and also not be located on significant ridgetops.

## Damage Scenic Resources, Including, but Not Limited to, Trees, Rock Outcroppings, and Historic Buildings Within a Designated Scenic Area – Wind (p. 3.1-18)

Based on the definitions and conditions identified in Table 2.0-1 of the Draft EIR, Tier 1 WECS projects may be located on scenic lands open to public views. However, these locations would not include those identified above for solar facilities and listed in Draft EIR subsection 2.6. As described above under Threshold 1, adherence to proposed County Code Section 22.32.060.C (height limitations of Tier 1 WECS installations), proposed County Code Section 22.32.060.D.7 (requires all wind turbine surfaces to be an unobtrusive color), and all County Code Title 22 requirements would ensure Tier 1 wind energy projects streamlined by the RESP would result in less than significant (Class III) impacts at scenic sites open to public view.

## Damage Scenic Resources, Including, but Not Limited to, Trees, Rock Outcroppings, and Historic Buildings Within a Designated Scenic Area – Policy Changes (p. 3.1-18)

As described above, the County's designated scenic areas are excluded from the proposed Program and no renewable energy facilities would be sited in these areas as a result of the Program. Therefore, less than significant (Class III) impacts from RESP policy changes would occur.

#### Substantially Degrade the Visual Character of an Area – Wind (p. 3.1-19)

Streamlined Tier 1 WECS would require an already built conforming structure. Such sites would not be within or on undisturbed natural landscape. As described above, adherence to proposed County Code Section 22.32.060.C (height limitations of Tier 1 wind energy installations), Section 22.32.060.D.7 (requires all wind turbine surfaces shall be an unobtrusive color), and all County Code Title 22 requirements would ensure Tier 1 wind energy projects streamlined by the RESP would result in less than significant (Class III) impacts with respect to changing the visual character of an area.

## Create a New Source of Substantial Glare or Night Lighting Which May Affect Surrounding Areas – Solar (pp. 3.1-19 through -20)

Structure-mounted Tier 1 SEFs would not result in significant sources of glare or lighting. Given structure-mounted Tier 1 SEF characteristics of height, panel size, and typical angle to receive solar rays, these smaller rooftop installations typically do not reflect glare on adjacent ground receptors. Additionally, Tier 1 rooftop facilities are not expected to require nighttime lighting.

Ground-mounted Tier 1 and all Tier 2 and 3 solar installations have the greatest potential to result in daytime glare and lighting impacts to adjacent receptors. To minimize the impacts of these solar facilities, proposed County Code Section 22.32.050.B specifies minimum setbacks of solar facilities to adjacent parcels. Setback standards will minimize glare intrusion to adjacent receptors. Additionally, proposed County Code Section 22.32.050.D requires that all solar facilities use nonreflective surfaces that minimize glare to the greatest extent feasible; rotating solar facilities must tracking system design and may not create concentrated reflections directed at occupied structures, recreation areas, County-designated SRAs, or roads; and exterior lighting is to be activated by motion sensors, fully shielded, and a downcast type where the light does not spill onto adjacent parcels or illuminate the night sky.

These proposed County Code Title 22 requirements ensure solar energy projects streamlined by the RESP would result in less than significant (Class III) impacts with respect to creating glare or light to surrounding properties.

## Create a New Source of Substantial Glare or Night Lighting Which May Affect Surrounding Areas – Wind (p. 3.1-20)

The scale of wind energy projects allowed under the proposed Program would not result in highly reflective surfaces or require nighttime lighting. Proposed County Code Section 22.32.060.D.5.a requires all wind installation materials and surfaces to be nonreflective, and proposed County Code Section 22.32.060.D.7.d requires no lighting, unless required by the Federal Aviation Administration. Adherence to these Title 22 requirements ensures wind energy projects streamlined by the RESP would result in less than significant (Class III) impacts with respect to creating glare or light to surrounding properties.

## Create a New Source of Substantial Glare or Night Lighting Which May Affect Surrounding Areas – Policy Changes (p. 3.1-20)

The implementation of policy changes proposed under the RESP would ensure all streamlined solar and wind projects would not generate adverse glare or lighting that could impact surrounding areas. Less than significant (Class III) impacts from RESP policy changes would occur.

#### Impact Unique Geological or Physical Features – Solar (p. 3.1-20)

Structure-mounted Tier 1 SEFs would not impact unique geological or physical features. Ground-mounted SEFs would not be sited within County-designated SRAs, areas covered by conservation easements, or parcels in the Open Space land use category. Therefore, ground-mounted SEFs proposed under the Program would not impact unique geological or physical features. Less than significant (Class III) impacts would occur.

#### Impact Unique Geological or Physical Features – Wind (pp. 3.1-20 through -21)

RESP streamlining would be limited to Tier 1 wind projects, which are limited to installations mounted on a roof of a structure or conforming use. Therefore, because these streamlined installations would be located on an existing structure on previously disturbed land, they would not be located on, or result in, changes to unique geological or physical features. The existing County of San Luis Obispo General Plan does not identify any prominent geologic features in the county. Figure 6.5-1 of the Renewable Energy Streamlining Program (RESP) Opportunities and Constraints Technical Study (OCTS) identifies only rock outcroppings throughout the county as geologic features. Some rock outcroppings are located in areas not under County jurisdiction (i.e., Carrizo Plain National Monument). Some of the identified rock outcroppings are located in areas that are identified as Unlikely to Streamline Renewable Energy, while the rest are located in areas that are Potentially Able to Streamline Energy.

Therefore, based on existing information on locations of rock outcroppings and those areas identified as areas with environmental constraints (such as unique geologic features, which includes rock outcroppings), streamlined Tier 1 wind facilities would not be located on or result in changes to or impact views of unique geological or physical features. Less than significant (Class III) impacts would occur.

#### Impact Unique Geological or Physical Features – Policy Changes (p. 3.1-20)

The implementation of policy changes proposed under the RESP would ensure all streamlined solar and wind projects proposed under the Program would avoid impacts to unique geological or physical features. Less than significant (Class III) impacts from RESP policy changes would occur.

#### Findings:

The County finds, based on the Draft EIR, the Final EIR, and the whole of the record, that the proposed Program will result in less than significant impacts associated with a substantial adverse effect on a scenic view (construction and wind); impacting scenic resources (i.e., trees, rock outcroppings and historic buildings) within a designated scenic are (solar, wind, and policy changes); degrading the visual character of an area (wind); creating a new source of glare or nighttime lighting (solar, wind, and policy changes); and impacting unique geological or physical features (solar, wind, and policy changes).

#### 6.2 AGRICULTURAL RESOURCES

#### Convert Important Agricultural Soils to Nonagricultural Use – Wind (pp. 3.2-49 through -50)

Tier 1 WECS must be roof- or structure-mounted and would not convert Important Agricultural Soils to nonagricultural use. Therefore, this impact would less than significant (Class III). Tier 2 WECS projects are subject to the same ground disturbance provisions as Tier 2 SEF projects; however, impacts are likely to be less than for SEF projects. Wind turbines typically occupy a much smaller footprint on the ground than a similarly sized SEF project and can be located so as to minimize impacts to Important Agricultural Soils.

Also, other than the actual footprint of the tower, it is possible to continue farming around the WECS equipment. Tier 2 WECS projects are also subject to discretionary approval through a Minor or Conditional Use Permit (see Table 3.2-5 of the Draft EIR); site-specific provisions regarding conversion of Important Agricultural Soils may apply. As WECS projects occupy much less land area than a similarly sized SEF project, can be located so as to avoid Important Agricultural Soils, and can allow farming around the installation, this impact is considered less than significant (Class III).

#### Conflict with Existing Zoning for Agricultural Use, or Williamson Act Program – Solar (p. 3.2-51)

As proposed in the Williamson Act Rules of Procedure (RoP), renewable energy projects can be located on active Williamson Act lands provided the renewable energy facility is 10 acres or less in area, maintains current eligibility criteria in the Rules of Procedure, and meets additional standards proposed in Appendix E6 of the RoP for renewable energy facilities. Roof-mounted solar has no impact on an agricultural use. Ground-mounted Tier 1 SEFs in specified land use categories could be allowable with Site Plan review countywide in the unincorporated non-Coastal Zone areas up to 10 acres in size. Ground-mounted Tier 2 and 3 SEF projects meeting the criteria of the RE Combining Designation would be allowable with Site Plan review up to 10 acres in size, but would not eligible for streamlining if proposed on Important Agricultural Soils (with the exception of an allowance on soils designated solely as Highly Productive Rangelands, provided conservation easement requirements are met per proposed standards 22.14.100.E and F). The provisions of the RoP are intended to preserve the Williamson Act contracts. As these provisions of the proposed Program would protect Important Agricultural Soils and ensure that agricultural will continue, the impacts are considered less than significant (Class III).

#### Conflict with Existing Zoning for Agricultural Use, or Williamson Act Program – Wind (p. 3.2-51)

Tier 1 WECS will be roof-mounted and will not interfere with any Williamson Act contract. Similar to SEF projects, Tier 2 and above WECS projects will be subject to the proposed RoP requirements that limit the location of the equipment and the extent of Williamson Act land that can be affected.

Compliance with the RoP ensures that the proposed Program will not result in the cancellation of a Williamson Act contract. Therefore, this impact would less than significant (Class III).

## Conflict with Existing Zoning for Agricultural Use, or Williamson Act Program – Policy Changes (pp. 3.2-51 through -52)

As proposed in the Williamson Act Rules of Procedure (RoP), renewable energy projects can be located on active Williamson Act lands provided the renewable energy facility is 10 acres or less in area, maintains current eligibility criteria in the Rules of Procedure, and meets additional standards proposed in Appendix E6 of the RoP for renewable energy facilities. Roof-mounted solar has no impact on an agricultural use. Ground-mounted Tier 1 SEFs in specified land use categories could be allowable with Site Plan review countywide in the unincorporated non-Coastal Zone areas up to 10 acres in size. Ground-mounted Tier 2 and 3 SEF projects meeting the criteria of the RE Combining Designation would be allowable with Site Plan review up to 10 acres in size, but would not eligible for streamlining if proposed on Important Agricultural Soils (with the exception of an allowance on soils designated solely as Highly Productive Rangelands, provided conservation easement requirements are met per proposed standards 22.14.100.E and F). The provisions of the RoP are intended to preserve the Williamson Act contracts. As these provisions of the proposed Program would protect Important Agricultural Soils and ensure that agricultural will continue, the impacts are considered less than significant (Class III).

#### Impair Agricultural Use of Other Property or Result in Conversion to Other Uses – Solar (p. 3.2-52)

Typical SEF projects result in at least some ground clearing to allow access and installation of ground-mounted equipment. The vegetation under and around the units must also be managed to reduce fire danger and avoid interference with the SEF units. In some instances, the ground under the units may be kept nearly vegetation free to aid in maintenance, in which case soil stabilizers are typically used to prevent dust since dust diminishes the performance of photovoltaic (PV) panels. In either a vegetated or cleared state, soil (dust) blowing onto adjacent agricultural properties during operation of an SEF would not be of a frequency or degree that would be expected to result in impairment or conversion of the agricultural use. Proposed performance standard 22.32.040.C.4 addresses the potential spread of weeds by requiring preparation of an Integrated Pest Management Plan for ground-mounted renewable energy-generating facilities. The plan would typically include a listing of plantings, herbicides used, and the frequency of use. Implementation of the proposed standards would reduce impacts related to operation of ground facilities to less than significant (Class III).

#### Impair Agricultural Use of Other Property or Result in Conversion to Other – Wind (p. 3.2-52)

Tier 1 WECS would be roof- or structure-mounted and will not impair the agricultural use of property or result in conversion of an agricultural use to a nonagricultural use. Tier 2 WECS projects are subject to the same requirements of proposed performance standard 22.32.040.C.4 and existing County regulations as SEFs. There are no operational characteristics that would otherwise be expected to result in the impairment or conversion of adjacent agricultural uses. Therefore, this impact would be less than significant (Class III).

## Impair Agricultural Use of Other Property or Result in Conversion to Other – Policy Changes (p. 3.2-52)

The proposed Program includes setbacks for equipment that could pose a hazard to crop dusting aircraft, as well as maintenance plans to ensure that invasive weeds do not affect adjacent agricultural uses. There are no policy changes that would otherwise be expected to

result in the impairment or conversion of adjacent agricultural uses. Therefore, this impact would be less than significant (Class III).

Findings:

The County finds, based on the Draft EIR, the Final EIR, and the whole of the record, that the proposed Program will result in less than significant impacts associated with converting important agricultural soils to nonagricultural uses (wind); conflicting with existing zoning for agricultural use, or Williamson Act program (solar, wind, and policy changes); and impairing agricultural use of other property or resulting in conversion to other uses (solar, wind, and policy changes).

#### 6.3 AIR QUALITY

Violate Any State or Federal Ambient Air Quality Standard, or Exceed Air Quality Emission Thresholds as Established by County Air Pollution Control District – Solar/Wind (pp. 3.3-18 through -23)

Some air pollutant emissions would be generated during the operation of renewable energy facilities from worker trips and equipment usage associated with ongoing operations, maintenance, repair, and security; however, such emissions would be negligible. As stated in Section 2.0, Project Description, of the Draft EIR, it is likely that up to three personnel would be required to service and maintain each Tier 1 SEF, Tier 2 SEF, and Tier 3 SEF facility. This would be comparable to about half the trips expected from one single-family residence, which would be considered a less than significant contribution to air emissions.

As analyzed in the EIR, the total land footprint assumed for development of these projects is 1,500 acres. For the purposes of this analysis, it is assumed that development of these 1,500 acres would occur over a period of 10 years. The projected criteria pollutant emissions resulting from construction activities were estimated using the California Emissions Estimator Model (CalEEMod). Results of the modeling are included in Appendix 3.3 of the Draft EIR.

As shown in Table 3.3-7 of the Draft EIR, construction emissions associated with the greatest amount of disturbance proposed for a single Tier 3 SEF project (160 acres) would not exceed SLOAPCD daily significance thresholds. However, although the largest individual Tier 3 projects may not generate significant short-term emissions, it is possible that several renewable energy projects instigated by the proposed Program would be under construction simultaneously and would generate cumulative construction emissions that could exceed thresholds and impact air quality. Therefore, construction-related air quality impacts generated by implementation of the proposed Program are considered potentially significant.

The SLOAPCD has developed construction Standard Mitigation Measures, including off-site mitigation, which are designed to reduce air pollutant emissions from construction activities and can be applied as necessary to reduce construction impacts below the significance thresholds. The proposed project does not change the current review process that will ensure that all RESP project comply with the SLOAPCD Standard Mitigation Measures. This ensures that all future renewable energy projects instigated by the proposed Program will be mitigated to levels of insignificance in terms of air quality.

## Violate Any State or Federal Ambient Air Quality Standard, or Exceed Air Quality Emission Thresholds as Established by County Air Pollution Control District – Policy Changes (p. 3.3-23)

As shown in Table 3.3-7 of the Draft EIR, construction emissions associated with the greatest amount of disturbance proposed for a single Tier 3 SEF project (160 acres) would not exceed SLOAPCD daily significance thresholds. While it is possible that several renewable energy projects instigated by the proposed Program would be under construction simultaneously and would generate cumulative construction emissions that could exceed thresholds and impact air quality, the SLOAPCD has developed construction mitigation measures, including off-site mitigation, which are designed to reduce air pollutant emissions from construction activities and can be applied as necessary to reduce construction impacts below the significance thresholds.

## **Expose Any Sensitive Receptor to Substantial Air Pollution Concentrations – Solar/Wind** (pp. 3.3-24 through -26)

#### **Toxic Air Contaminants**

As stated in the Draft EIR, none of the actions proposed as part of the proposed Program would result in a major source of toxic air contaminant concentrations, which include industrial processes (e.g., petroleum refining and chrome-plating operations), commercial operations (e.g., gasoline stations and dry cleaners), and substantial amounts of motor vehicle exhaust (e.g., distribution centers and warehouses). One of the benefits of solar and wind energy is that the production of electricity from these sources involves negligible emissions of air pollutants.

Construction associated with implementation of solar and wind energy projects would result in the generation of diesel particulate matter emissions. The use of diesel-powered construction equipment associated with development of solar and wind energy generation projects would be temporary and episodic and would occur over several locations isolated from one another. Development under the proposed Program would be subject to, and would comply with, Title 13, Section 2449(d)(3) of the California Code of Regulations (California Heavy-Duty Vehicle Idling Emission Reduction Program), which limits idling of diesel-fueled off-road equipment to no more than 5 minutes, which would further reduce nearby sensitive receptors' exposure to temporary and variable diesel particulate matter emissions.

Furthermore, as previously all development projects would be required to comply with SLOAPCD BACT measures requiring the use of Tier 3 and Tier 4 construction equipment that substantially reduce the amount of generated exhaust emissions. In addition, County Code Section 22.52.160, Construction Procedures, establishes measures to address potential impacts to sensitive receptors within 1,000 feet of most construction sites. County Code Section 22.60.050 also calls for APCD review of discretionary development projects.

Future renewable energy projects that would involve diesel-powered construction activity in close proximity to any sensitive receptor would also be required to implement measures to ensure that public health benefits are realized by reducing toxic risk from diesel emissions (California Diesel Idling Regulations and Diesel Idling Restrictions Near Sensitive Receptors, both discussed in Draft EIR Section 3.3 Air Quality). For these reasons and because diesel fumes disperse rapidly over relatively short distances, diesel particulate matter generated by construction activities, in and of itself, would not be expected to create conditions where the probability of contracting cancer is greater than 10 in 1 million for nearby receptors, the statewide significance threshold.

#### Construction and Naturally Occurring Asbestos

The SLOAPCD has identified areas throughout the county where naturally occurring asbestos (NOA) may be present. Construction activities that result in the disturbance of NOA-containing soils can result in the airborne entrainment of asbestos. The California Department of Conservation's A General Location Guide for Ultramafic Rocks in California-Areas More Likely to Contain Naturally Occurring Asbestos identifies NOA-containing soils present exclusively in the Coastal Zone of the county, which is not affected by the proposed Program. Furthermore, County Code Section 22.52.160 addresses the potential to encounter NOA during grading by mandating that prior to any grading activities in NOA candidate areas, the project proponent must prepare a geologic evaluation to determine whether NOA is present within the area that will be disturbed.

If NOA is not present, an exemption request must be filed with the SLOAPCD. If NOA is found, the project applicant would be required to comply with the requirements listed in the California Air Resources Board's (CARB's) Asbestos Air Toxics Control Measure (ATCM) for Construction, Grading, Quarrying, and Surface Mining Operations. These CARB requirements mandate that all construction occurring in an area with NOA-containing soils prepare and submit an Asbestos Dust Mitigation Plan for approval by the local air district. The Asbestos Dust Mitigation Plan must identify asbestos dust mitigation. For these reasons, potential impacts from NOA would be less than significant (Class III).

#### Construction and Valley Fever

The California Department of Public Health considers San Luis Obispo County a highly endemic area for valley fever. When soil containing this fungus is disturbed by construction activities such as digging or grading, by vehicles raising dust, or by the wind, the fungal spores get into the air. When people breathe the spores into their lungs, they may get valley fever. Fungal spores are small particles that can grow and reproduce in the body. The highest infection period for valley fever occurs during the dry months in California between June and November.

Infection from valley fever during construction can be partially mitigated through the control of construction-generated dust. As noted, construction-generated dust would be controlled by adhering to the mandatory requirements of the SLOAPCD Fugitive Dust Mitigation Measures. In addition, the California Department of Public Health provides recommendations for reducing the potential for valley fever infection during construction activities. The SLOAPCD Fugitive Dust Mitigation Measures are identified under Impact 3-8-2 of Section 3.8, Hazards and Hazardous Materials, in the Draft EIR. This impact is less than significant (Class III).

## Expose Any Sensitive Receptor to Substantial Air Pollution Concentrations – Policy Changes (pp. 3.3-26 through -27)

The implementation of the proposed policy changes to the General Plan would enable streamlined reviews and approvals of eligible SEF and WECS projects to be achieved either through the building permit process, zoning clearance process, or site plan review process. As discussed above, although there are pollutant emissions associated with implementation of the Program, they would not be significant. Associated County policy changes would be updated for consistency with the objectives of this streamlining effort. Therefore, impacts are less than significant (Class III).

#### Create or Subject Individuals to Objectionable Odors – Solar/Wind (p. 3.3-27)

The development allowed under the proposed Program would not result in the installation of any equipment or processes that would be considered major odor emission sources. However, activities associated with construction would involve the use of a variety of gasoline- or diesel-powered equipment that would emit exhaust fumes. While exhaust fumes, particularly diesel exhaust, may be considered objectionable by some people, construction-generated emissions would occur intermittently throughout the workday and would dissipate rapidly with increasing distance from the source. The construction phase is a short-term condition lasting a week to a year depending on the size of the facility. In addition, County Code Section 22.52.160, Construction Procedures, establishes measures to address potential impacts to sensitive receptors within 1,000 feet of most construction sites. As a result, potential exposure of sensitive receptors to odors associated with proposed Program would be considered less than significant (Class III).

#### Create or Subject Individuals to Objectionable Odors – Policy Changes (p. 3.3-27)

The implementation of the proposed policy changes to the General Plan would enable streamlined reviews and approvals of SEF and WECS facility projects to be achieved either through the building permit process, zoning clearance process, or site plan review process. These facilities would not require any equipment or processes that would be considered major odor emission sources. This impact is less than significant (Class III).

#### Be Inconsistent with the District's Clean Air Plan – Solar/Wind (pp. 3.3-28 through -32)

Air pollutants emitted into the ambient air of the county are emitted primarily by mobile sources (traffic) during construction and operational activities. While there would be some air pollutant emissions generated during the operations of renewable energy facilities from worker trips and equipment usage associated with ongoing operations, maintenance, repair, and security, such emissions would be negligible due to the limited amount of personnel required to service and maintain each Tier 1 SEF, Tier 2 SEF, and Tier 3 SEF facility.

The SLOAPCD has developed construction mitigation measures, including off-site mitigation, which are designed to reduce air pollutant emissions from construction activities and associated construction worker commutes. For these reasons, future construction of renewable energy facilities under the proposed Program would be less than significant in terms of air quality. In addition, the renewable energy-generating facilities allowed under the proposed Program produce energy that is largely emissions-free. One of the obvious benefits of solar and wind energy is that the production of electricity from these sources involves almost no direct air pollutant emissions, with the exception of negligible emissions from worker trips and equipment usage associated with ongoing operations, maintenance, repair, and security. By nature, these facilities do not produce air pollutant emissions; regionally speaking, they reduce emissions by decreasing the need for energy from fossil fuel-based power plants, which is considered a beneficial impact. For these reasons, the proposed Program would not conflict with or inhibit the Clean Air Plan measures that address state and federal ambient air quality standards. Additionally, Table 3.3-8 in Section 3.3, Air Quality, of the Draft EIR presents a comparison of the proposed Program (SEF facilities and wind energy conversion systems) to the specific Clean Air Plan policy provisions intended to address air quality standards. As shown in Table 3.3-8, the proposed Program would not conflict with the SLOAPCD Clean Air Plan.

SEF and WECS facilities would vary in size; however, the maximum size and magnitude of projects permitted under the RESP (160-acre SEFs maximum) would not result in significant impacts on local roadways. Furthermore, given the small number of traffic trips generated by operations of solar

energy projects, the associated negligible increase in trips on local roadways and highways would not adversely impact the local transportation system or otherwise degrade traffic operations, and thus would not result in the generation of a substantial amount of mobile source air pollutants. Additionally, solar and wind energy facilities produce emissions-free energy and by their nature do not produce air pollutant emissions. Instead they reduce emissions by decreasing the need for energy from fossil fuel-based power plants, which is considered a beneficial impact regionally and statewide. Therefore, this is a less than significant impact (Class III).

### Be Inconsistent with the District's Clean Air Plan – Policy Changes (p. 3.3-32)

The implementation of the proposed policy changes to the General Plan would enable streamlined reviews and approvals of SEF and WECS facility projects to be achieved either through the building permit process, zoning clearance process, or site plan review process. These facilities produce energy that is largely emissions-free and by their nature do not produce air pollutant emissions. Instead they reduce emissions by decreasing the need for energy from fossil fuel-based power plants, which is considered a beneficial impact regionally and statewide. Therefore, the proposed Program would not conflict with the SLOAPCD 2001 Clean Air Plan, which is intended to address state and federal air quality standards and ensure that long-term trends in air quality improvements are not disrupted. This is a less than significant (Class III) impact.

#### Findings:

The County finds, based on the Draft EIR, the Final EIR, and the whole of the record, that the proposed Program will result in less than significant impacts associated with violating any state or federal ambient air quality standard, or exceeding air quality emission thresholds as established by county air pollution control district (solar/wind and policy changes); exposing any sensitive receptor to substantial air pollution concentrations (solar/wind and policy changes); creating or subjecting individuals to objectionable odors (solar/wind and policy changes); and being inconsistent with the district's clean air plan (solar/wind and policy changes).

#### 6.4 BIOLOGICAL RESOURCES

Result in a Loss of Unique or Special-Status Species or Their Habitats – Solar (pp. 3.4-35 through -36)

Section 3.4, Biological Resources, of the Draft EIR discusses several proposed performance standards in the LUO that would significantly reduce any potential avian-related impacts associated with Tier 1 solar projects. As proposed, implementation of roof-mounted Tier 1 SEF solar projects under the RESP would result in impacts that are less than significant (Class III).

Tier 1, 2, and 3 SEFs could be streamlined with implementation of proposed performance standard 22.14.100.F.2, which requires the preparation of a botanical and biological report demonstrating that the project site does not contain sensitive biological resources that would be impacted by the project. For each project, the proponent would submit a biological resources report prepared by a County-approved biologist, which would require a habitat assessment for special-status species.

Direct and indirect impacts to sensitive biological resources in adjacent areas would be avoided through the implementation of proposed development standards. These include setbacks (i.e., buffers) around projects (Development Standard 22.14.100.F.4- 6), a weed management plan to minimize the potential for introduction and spread of invasive weeds (Development Standard 22.32.040.C.4), and only non-invasive species allowed in landscaping. Dust control and the

implementation of other best management practices are required by existing LUO Chapter 22.52. Implementation of these development standards would ensure that the RESP would result in less than significant (Class III) impacts to special-status species or other sensitive biological resources.

# Result in a Loss of Unique or Special-Status Species or Their Habitats – Wind (pp. 3.4-36 through -37)

Streamlining of wind projects under the RESP would be limited to Tier 1 wind energy conversion systems (WECS), which are limited to a height of 10 feet above the building for agricultural, rural, and public facilities for a maximum height of 45 feet, and no more than 5 feet above the building for a maximum height of 40 feet for residential and commercial land uses (proposed County Code Section 22.32.060.C). Although special-status species could collide with these facilities, as with SEF projects, the magnitude of these effects is expected to be extremely low. With implementation of proposed development standards, impacts from the construction and operation of Tier 1 WECS would be less than significant (Class III).

Tier 2 and above ground-mounted WECS projects could result in avian mortality due to the size and number of turbines in a close pattern. The siting of WECS projects of this scale requires careful study of bird migration patterns, understanding of local habitat and foraging areas, and identification of the types of bird species likely to frequent the project site. Because this information is site-specific, the RESP requires a site-specific biological report for Tier 2 WECS projects in the combining designation and either a Minor or Conditional Use Permit and accompanying CEQA analysis for projects outside of the combining designation.

If Tier 2 WECS projects within the combining district cannot be designed to result in a less than significant impact (Class III), the project is not eligible for the streamlining program and must proceed under the traditional approval process. The traditional approval process would require independent environmental analysis under CEQA as well as approval of either a Minor or Conditional Use Permit. As designed, this impact is considered less than significant (Class III).

### Result in a Loss of Unique or Special-Status Species or Their Habitats – Policy Changes (p. 3.4-37)

The streamlining provisions of the proposed Program only apply to projects that cannot have an impact to biological resources (e.g., mounted on existing buildings) or that can demonstrate that there is no biological impact through a professionally prepared biological study. Nearly every project can have some biological impact; however, in most cases the project will simply be designed to avoid or eliminate the potential impact. This is done frequently with projects where driveways, grading, construction, and operational characteristics can all be intentionally designed to avoid impacting resources. As these changes are both site- and project-specific, there is no way to determine the extent of project design change in this EIR. The proposed Program establishes performance standards that address potential impacts (e.g., LUO 22.14.100.F) and further restrict project locations near wetlands and sensitive habitat by establishing minimum setbacks. Adherence to the proposed RESP would ensure projects would minimize impacts to special-status species and habitat. This impact would be less than significant (Class III).

# Reduce the Extent, Diversity, or Quality of Native or Other Important Vegetation – Solar (pp. 3.4-37 through -38)

Tier 1 solar installations would be located on top of existing structures or within developed areas that do not support sensitive biological resources; therefore, implementation of Tier 1 solar projects under the RESP would not result in significant impacts to native or other important

vegetation. Ground-mounted Tier 1 SEF projects must obtain site plan approval that requires preparation of both botanical and biological reports to ensure that the site does not include sensitive species (LUO 22.60.040).

Tier 2 SEF projects within the combining designation could result in projects up to 40 acres in size. The proposed LUO requires that these sites be located in urban areas or in rural areas on sites designated as Commercial Service (CS) or Industrial (IND) (proposed LUO 22.32.050.A).

Construction and operation of ground-mounted SEF facilities could result in impacts to vegetation both on-site and on adjacent sites through introduction of invasive weeds, overspray of herbicides, and dust covering vegetation. Provisions of the proposed LUO reduce the impact of SEF projects on adjacent vegetation by requiring project setbacks (proposed LUO 22.32.050.B), a weed management plan to minimize the potential for introduction and spread of invasive weeds (proposed LUO 22.32.040.C.4), and mandating that only non-invasive species be allowed in landscaping. Dust associated with the construction and operation of ground-mounted SEFs is addressed through implementation of best management practices required by existing LUO Chapter 22.52.

Tier 2 and Tier 3 SEF projects outside of the combining designation are subject to proposed performance standards that require preparation of a biological report demonstrating that the project will not significantly impact any sensitive biological resources. If a project cannot demonstrate a less than significant impact (Class III) on native or other important vegetation, project-level analysis under CEQA would be required and the project would not be eligible for streamlining under the RESP.

Program requirements ensure SEF projects would either demonstrate that impacts to sensitive biological resources would be less than significant (Class III) or that the resources have been avoided entirely through the implementation of proposed development standards. As designed, the proposed Program reduces impacts to native vegetation to a less than significant level (Class III).

Reduce the Extent, Diversity, or Quality of Native or Other Important Vegetation – Wind (pp. 3.4-38 through -39)

Rooftop construction of Tier 1 WECS equipment may impact nearby grasslands or vegetation, as equipment may be necessary to hoist equipment to the roof of the building and gain access to the site. Most buildings in rural environments are required to have a clear area for fire protection, and it is anticipated that the fire break setback around the structure would be used for the staging and construction of roof-mounted WECS equipment. It is possible that some tree limbs or vegetation may need to be trimmed to allow passage of larger vehicles; however as the Tier 1 projects are to be located on existing buildings, the assumption is that there is adequate existing access. There may be a temporary impact associated with driving on grassland or vegetation; however, the area is expected to recover as the interaction will likely be less than two weeks and no follow-up construction would be necessary. Other than vehicle and pedestrian movement, no ground disturbance would be associated with building-mounted equipment.

Ground-mounted WECS projects are required to provide a biological report that will include measures designed to reduce impacts to less than significant. If the project modifications cannot reduce impacts to Class III, then the project will not qualify for streamlining and must obtain either a Minor or Conditional Use Permit, which will require independent project-specific CEQA analysis and mitigation. Impacts to native vegetation from the construction and operation of WECS projects are considered less than significant (Class III).

# Reduce the Extent, Diversity, or Quality of Native or Other Important Vegetation – Policy Changes (p. 3.4-39)

The proposed Program was designed to avoid sensitive areas. Projects that cannot demonstrate that absence and avoidance of sensitive species and habitat are not eligible for the proposed RESP. Therefore, the policy changes proposed with the RESP are considered less than significant (Class III).

#### Impact Wetland or Riparian Habitat – Solar (pp. 3.4-39 through -40)

Tier 1 SEFs would be located on top of existing structures or within developed areas that do not support sensitive biological resources; therefore, implementation of Tier 1 solar projects under the RESP would not result in impacts to wetland or riparian habitat.

Direct impacts to wetland and riparian habitat from Tier 2 and Tier 3 solar projects that would require state or federal permitting, and projects that may impact these features are not eligible for streamlining under the RESP. Impacts to sensitive biological resources in adjacent areas would be avoided through the implementation of proposed development standards. These include setbacks (i.e., buffers) around projects, a weed management plan to minimize the potential for introduction and spread of invasive weeds, and only non-invasive species allowed in landscaping. Dust control and the implementation of other best management practices are required by existing LUO Chapter 22.52. Implementation of these development standards would minimize or avoid impacts to wetland and riparian habitats to a less than significant level (Class III).

#### Impact Wetland or Riparian Habitat – Wind (p. 3.4-40)

Tier 1 wind turbines are mounted on a roof or structure of a conforming use, with no associated ground disturbance. Therefore, construction and operation would not result in direct or indirect impacts to wetland or riparian habitat. Impacts would be less than significant (Class III).

### Impact Wetland or Riparian Habitat – Policy Changes (p. 3.4-40)

As previously discussed, adherence to policy changes proposed under the RESP would ensure projects would minimize impacts to wetland and riparian habitat. Impacts would be less than significant (Class III).

### Interfere with the Movement of Resident or Migratory Fish or Wildlife Species, or Factors Which Could Hinder the Normal Activities of Wildlife – Solar (pp. 3.4-40 through -41)

Tier 1 SEF projects would be located on roofs or other structures or on disturbed sites with no biological resources. Proposed performance standard LUO 22.32.050.D.1 states that solar panels must have nonreflective surfaces to minimize glare. The nonreflective surface and the angle associated with the roof will avoid the solar panels being mistaken for windows as might occur with a vertical installation. Additionally, Tier 1 SEF ground-mounted facilities are required to obtain site plan approval that involves preparation of botanical and biological reports. These reports will determine whether the proposal is eligible for processing as a Tier 1, or because of potential impacts to wildlife movement, must be processed with additional CEQA analysis and a Minor or Conditional Use Permit. Implementation of Tier 1 solar projects under the RESP would result in a less than significant impact (Class III) to wildlife movement or migration.

Tier 2 SEF ground-mounted projects within the combining designation can be up to 40 acres in size but can only be located on land that is graded, disturbed, or altered, located on Brownfield

land that was previously developed for industrial or commercial purposes, and degraded or contaminated and then abandoned or underused (proposed LUO 22.32.050.A.3). Parcels eligible for inclusion in the combining designation were also screened to reduce the potential to affect known sensitive habitats or wildlife corridors. Tier 2 SEF and above projects outside of the combining designation could be between 40 acres and 160 acres in size. Projects of this size can impede wildlife seasonal migration or daily movement if constructed within a movement corridor. However, these projects are required by performance standard LUO 22.14.100.C to prepare a biological resources report as part of the application, which is specific to the project and design. The report will determine whether the project can avoid any identified migration corridor or whether additional analysis is necessary. Further, projects of this size outside of the combining designation must obtain a Minor or Conditional Use Permit, which is discretionary and requires independent project-specific environmental analysis.

During construction, ground disturbance, noise and vibration, and general disturbance from human activity can discourage wildlife use or result in hazards to wildlife attempting to move through the area; however, these effects would be minimized through implementation of development standards in sections 22.14.100.F 1, 3, 5 and 6 of the proposed LUO requiring setbacks from areas that could be used by wildlife. During operation, fences or operations and maintenance activities can exclude wildlife. Development standards requiring setbacks and wildlife-friendly fencing would reduce impacts to a less than significant (Class III) level. No interference with fish migration or movement would occur, as eligible projects would not impact wetlands or waters.

## Interfere with the Movement of Resident or Migratory Fish or Wildlife Species, or Factors Which Could Hinder the Normal Activities of Wildlife – Wind (p. 3.4-41)

Streamlining of wind projects under the RESP is limited to Tier 1 WECS, which are installations mounted on a roof of a structure or conforming use. As discussed above, roof-mounted WECs equipment is not likely to result in impacts to birds. Roof-mounted facilities will be on buildings that are well separated, allowing movement all around them and resulting in no impact to bird migratory patterns or movement. With implementation of proposed development standards, impacts to wildlife movement and migration from Tier 1 WECS would be less than significant (Class III).

Tier 2 and above WECS projects could result in avian mortality due to the size and number of turbines in a close pattern. The siting of WECS projects of this scale requires careful study of bird migration patterns, understanding of local habitat and foraging areas, and identification of the types of bird species likely to frequent the project site. Because this information is site-specific, the RESP requires a site-specific biological report for Tier 2 WECS projects in the combining designation and either a Minor or Conditional Use Permit and accompanying CEQA analysis for projects outside of the combining designation. If Tier 2 WECS projects within the combining district cannot be designed to result in a less than significant impact (Class III), the project is not eligible for the streamlining program and must proceed under the traditional zoning approval process. As designed, this impact is considered less than significant (Class III).

## Interfere with the Movement of Resident or Migratory Fish or Wildlife Species, or Factors Which Could Hinder the Normal Activities of Wildlife – Policy Changes (p. 3.4-42)

The proposed project is specifically designed to guide renewable energy projects to areas with minimal biological impact. Tier 1 SEF and WECS projects are to be mounted on buildings or on previously disturbed soils. Tier 1 SEF ground-mounted installations must also obtain site plan approval that requires preparation of a botanical and biological report (LUO 22.60.040). These

reports will be used to ensure that a project does not have a significant impact on wildlife movement. Tier 2 projects inside the combining designation must maintain a setback from sensitive bird nesting habitat, wetlands, drainages, and vernal pools. Tier 2 and above SEF and WECS projects outside of the combining designation must obtain either a Minor or Conditional Use Permit. These discretionary permits require site-specific environmental analysis. Through a combination of proposed LUO performance standards and prohibition, the proposed project will have a less than significant (Class III) impact on wildlife activities.

Conflict with Any Regional Plans or Policies to Protect Sensitive Species, or with Regulations of the California Department of Fish and Wildlife or US Fish and Wildlife Service – Solar (pp. 3.4-42 through -43)

Tier 1 solar installations would be located on top of existing structures or within developed areas that do not support sensitive biological resources; therefore, implementation of Tier 1 solar projects under the RESP would not result in significant impacts to sensitive biological resources protected by local, regional, state, or federal plans, policies, or regulations.

Any project with impacts to species regulated by the California Department of Fish and Wildlife (CDFW) or the US Fish and Wildlife Service (USFWS) that would require state or federal permitting is not eligible for streamlining under the RESP. Impacts to sensitive species covered under regional plans or policies from Tier 2 and Tier 3 SEFs would be as described under Threshold 1 (Result in a Loss of Unique or Special-Status Species or Their Habitats). Birds and bats could potentially collide with Tier 2 and Tier 3 solar projects. As proposed, the RESP was specifically designed to avoid conflicting with regional plans or policies or with federal or state regulations. Therefore, this impact is considered less than significant (Class III).

Direct and indirect impacts to sensitive biological resources in adjacent areas would be avoided through the implementation of proposed development standards. These include setbacks around projects and a weed management plan to minimize the potential for introduction and spread of invasive weeds. Dust control and the implementation of these development standards would ensure that the RESP would not result in significant impacts to sensitive biological resources protected by local, regional, state, or federal plans, policies, or regulations. In addition, Development Standard 22.14.100.F.1–2 would require compliance with applicable standards from regional plans or policies, including compliance with the conservation easement requirements of the County's San Joaquin Kit Fox Program. With implementation of development standards, impacts would be less than significant (Class III).

Conflict with Any Regional Plans or Policies to Protect Sensitive Species, or with Regulations of the California Department of Fish and Wildlife or US Fish and Wildlife Service – Wind (p. 3.4-43)

Tier 1 wind turbines are mounted on a roof or structure of a conforming use and would not impact most sensitive species. Birds and bats could potentially collide with Tier 1 WECS. Although species protected by local, regional, state, or federal plans, policies, or regulations could collide with these facilities, the magnitude of these effects is expected to be low. Therefore, conflicts with regional plans or policies or with federal or state regulations would be less than significant (Class III).

Conflict with Any Regional Plans or Policies to Protect Sensitive Species, or with Regulations of the California Department of Fish and Wildlife or US Fish and Wildlife Service – Policy Changes (p. 3.4-43)

The proposed Program was specifically designed to direct SEF and WECS projects to areas with minimal biological value. Tier 1 roof-mounted projects would utilize the existing building footprint instead of disturbing new ground. Pursuant proposed LUO 22.14.100.F., ground-mounted SEFs must obtain a site plan approval that requires preparation of biological and botanical reports to ensure that sensitive species are not impacted.

The RESP specifically precludes any project from the Program if it needs a state or federal permit for approval. This would preclude streambed alteration permits and wetland fill permits. The streamlining policies proposed with the RESP are not intended to apply to all projects. The RESP acknowledges that projects that do not qualify for streamlining are able to follow the traditional method of project consideration (e.g., Minor or Conditional Use Permit). These methods allow consideration of site-specific project features as well as project-specific mitigation measures. Policy changes proposed under the RESP would not conflict with existing applicable regional plans or policies and would not conflict with state or federal regulations protecting biological resources. Impacts would be less than significant (Class III).

#### Findings:

The County finds, based on the Draft EIR, the Final EIR, and the whole of the record, that the proposed Program will result in less than significant impacts associated with resulting in a loss of unique or special-status species or their habitats (solar, wind, and policy changes); reducing the extent, diversity, or quality of native or other important vegetation (solar, wind, and policy changes); impacting wetland or riparian habitat (solar, wind, and policy changes); interfering with the movement of resident or migratory fish or wildlife species, or factors which could hinder the normal activities of wildlife (solar, wind, and policy changes); and conflicting with any regional plans or policies to protect sensitive species, or with regulations of the California Department of Fish and Wildlife or US Fish and Wildlife Service (solar, wind, and policy changes).

### 6.5 CULTURAL RESOURCES

Cause a Substantial Adverse Change in the Significance of a Historical Resource – Solar (pp. 3.5-25 through -26)

Tier 1 solar electric facilities (SEFs) will be mounted on existing buildings and structures or on previously disturbed land. As some of the structures eligible for roof-mounted systems will be 50 years of age or older, it is possible that the historic integrity of the building may be diminished. This could occur as the energy-generating equipment would be an obvious change on the roof. This change could affect the historic setting of the roof or otherwise affect the features that could contribute to eligibility for listing as a historic resource. Proposed performance standard 22.32.050.D.2 for roof-mounted Tier 1 SEF projects requires that the equipment be designed to be removed at a later date and that the roof can be returned to its original pre-project condition. As the change to the roof to install the equipment is temporary and the equipment can be removed and the building's roof restored, this impact is considered less than significant (Class III).

In the case of ground-mounted Tier 2 and 3 SEF projects, as required by proposed performance standard 22.14.100.F.7, a Cultural Resources Report would be required Where the Cultural Resources Report identifies any potential resources, the applicant would also submit the

following: (1) 100 percent field survey of the proposed project area where all identified resources are recorded on forms required by the State Historic Preservation Officer (SHPO); (2) correspondence with Native American contacts provided by the Native American Heritage Commission (NAHC) and a search of the sacred lands database maintained by the NAHC to identify sensitive resources; and (3) a technical report presenting the results of these studies, the identification of any resources that might be historic resources, and management and treatment recommendations for these resources in a report format meeting SHPO guidelines to identify measures the project would employ to avoid direct or indirect impacts to any potential resources. Projects which cannot demonstrate that they meet the above requirements would require additional project-level CEQA review.

Proposed performance standard 22.14.100.F.7.c would reduce potential impacts to known historical resources. Impacts to any inadvertently discovered cultural resources or human remains would be addressed through 22.10.040.A and B. Therefore, this impact is considered less than significant (Class III).

## Cause a Substantial Adverse Change in the Significance of a Historical Resource – Wind (p. 3.5-26)

Tier 1 WECS projects would be roof-mounted and would be subject to proposed performance standard section 22.32.060.D.2 that requires equipment be designed to be removed. This performance standard is needed as the energy-generating equipment would be an obvious change on the roof. This change could affect the historic setting of the roof or otherwise affect the features that could contribute to eligibility for listing as a historic resource. Ground-mounted Tier 1 WECS projects would be located on previously disturbed soils and subject to LUO 22.10.040 regulating the discovery of human remains.

Tier 2 and above WECS projects are ground-mounted and would be subject to either a Minor or Conditional Use Permit. These discretionary permits would require a cultural resources survey as part of the independent site specific analysis and CEQA review in support of either a Minor or Conditional Use Permit.

Implementation of existing LUO 22.10.040 regarding the discovery of human remains, and proposed performance standard 22.32.060.D.2 that ensures roof-mounted equipment can be removed from older buildings, and the requirement to conduct a site-specific cultural resource study for projects on undisturbed soils will ensure that all cultural resource impacts will be addressed. This impact is considered less than significant (Class III).

# Cause a Substantial Adverse Change in the Significance of a Historical Resource – Policy Changes (pp. 3.5-26 through -27)

Through application of the existing LUO and the proposed streamlining eligibility criteria and associated performance standards discussed above, potential impacts to cultural resources are considered less than significant (Class III).

## Cause a Substantial Adverse Change in the Significance of an Archaeological Resource – Solar (p. 3.5-27)

Tier 1 SEF projects that will be located on rooftops will have no potential to impact archaeological resources, as there would be little to no ground disturbance. In most instances, Tier 1 SEF projects on existing buildings will use existing electrical services. LUO Section 22.10.040 provides standards for the discovery of human remains should that occur during any trenching.

For ground-mounted Tier 1 SEFs, performance standard 22.32.050.A.3 requires that the area be previously disturbed, which eliminates the potential for disturbing archaeological resources at the surface. LUO Section 22.10.040 provides standards for the discovery of human remains should that occur during any trenching or excavation.

For Tier 2 and 3 SEF projects, as required by proposed performance standard 22.14.100.F.7, a Cultural Resources Report would be required. Where the Cultural Resources Report identifies any potential resources, the applicant would also submit the following: (1) 100 percent field survey of the proposed project area where all identified resources are recorded on forms required by the State Historic Preservation Officer (SHPO); (2) correspondence with Native American contacts provided by the Native American Heritage Commission (NAHC) and a search of the sacred lands database maintained by the NAHC to identify sensitive resources; and (3) a technical report presenting the results of these studies, the identification of any resources that might be historic resources, and management and treatment recommendations for these resources in a report format meeting SHPO guidelines to identify measures the project would employ to avoid direct or indirect impacts to any potential resources. Projects which cannot demonstrate that they meet the above requirements would require additional project-level CEQA review. As the proposed Program will either avoid any ground disturbance by design or will require site-specific analysis as a performance measure, this impact is considered less than significant (Class III).

## Cause a Substantial Adverse Change in the Significance of an Archaeological Resource – Wind (p. 3.5-27)

As with SEF projects, Tier 1 WECS projects will either be located on a rooftop or on previously disturbed soils. Tier 2 and above WECS projects located on undisturbed soils within the combining designation are required to obtain either a Minor or Conditional Use Permit. Consideration of these discretionary permits will require a CEQA analysis that will include a cultural resource study. This impact is considered less than significant (Class III).

## Cause a Substantial Adverse Change in the Significance of an Archaeological Resource – Policy Changes (p. 3.5-27)

Adherence to policy changes proposed under the RESP would minimize impacts to cultural resources. This impact is considered less than significant (Class III).

# Disturb Any Human Remains Including Those Interred Outside Formal Cemeteries – Solar (p. 3.5-28)

Tier 1 projects will either be roof-mounted or directed to areas where the ground has been previously disturbed. Tier 2 and above projects will be required to conduct project-specific cultural analysis. While there is a potential for human remains to be discovered during grading or trenching activities, LUO Section 22.10.040 establishes a procedure to be followed if remains are discovered. CEQA Section 15064.5(e) establishes a process to be followed if the coroner believes that the remains are Native American. Therefore, this impact is considered less than significant (Class III).

## Disturb Any Human Remains Including Those Interred Outside Formal Cemeteries – Wind (p. 3.5-28)

Tier 1 WECS projects within the combining designation will be roof-mounted. Projects on undisturbed soils and Tier 2 and above projects outside of the combining designation will be required to conduct project-specific cultural analysis. While there is a potential for human

remains to be discovered during grading or trenching activities, LUO Section 22.10.040 establishes a procedure to be followed if remains are discovered. CEQA Section 15064.5(e) also establishes a process to be followed if the coroner believes that the remains are Native American. Therefore, this impact is considered less than significant (Class III).

## Disturb Any Human Remains Including Those Interred Outside Formal Cemeteries – Policy Changes (p. 3.5-28)

Policy changes proposed with the RESP would streamline renewable energy projects within the combining designation. Tier 1 projects could occur throughout the county, but would either be roof-mounted and therefore unlikely to disturbed buried remains, or directed to previously disturbed areas and subject to LUO Section 22.10.040 governing the discovery of human remains and also to Public Resources Code Section 5097.94 for the discovery of Native American remains. Tier 2 and above projects will be required to conduct project-specific cultural analysis. While there is a potential for human remains to be discovered during grading or trenching activities, LUO Section 22.10.040 establishes a procedure to be followed if remains are discovered. CEQA Section 15064.5(e) establishes a process to be followed if the coroner believes that the remains are Native American. None of the proposed policy changes would circumvent the existing regulations concerning human remains. This impact is considered less than significant (Class III).

## Cause a Substantial Adverse Change in the Significance of a Paleontological Resource – Solar (p. 3.5-29)

Tier 1 SEFs would consist of photovoltaic panels mounted on rooftops of other structures as well as small to medium-sized ground-mounted systems. Rooftop installations would have no impact on paleontological resources. Ground-mounted systems would either be directed to disturbed soils or require additional study with Site Plan Review. Unless the bedrock is exposed, the potential for impact may not be known until trenching or soils information associated with construction materials is provided. Because of the cost of constructing in bedrock and the abundance of areas where bedrock can be avoided, it is very unlikely that ground-mounted SEF projects would encounter paleontological resources. All ground-mounted renewable energy facilities would avoid exposed bedrock, rock outcrops, or significant ridgetops as directed by proposed standard 22.32.040.C.4. This impact is considered less than significant (Class III).

# Cause a Substantial Adverse Change in the Significance of a Paleontological Resource – Wind (p. 3.5-29)

The proposed Program would allow WECS facilities that are mounted to rooftops of existing structures. Construction of these facilities would occur entirely on top of a pre-existing structure, based on the criteria for Tier 1 WECS proposed in 22.32.030.A.3. Construction activities would be confined to the built environment footprint or a nearby laydown area and aboveground. Therefore, these facilities would not negatively affect paleontological resources.

Construction of footings to support towers for Tier 2 and 3 WECS could affect resources, as excavation may encounter bedrock. As part of the engineering approval process, the County would require submission of a geotechnical study that will identify the soils types and the potential to encounter bedrock. As projects of this size will also require a Minor or Conditional Use Permit and accompanying CEQA review that will include preparation of a cultural resources study, appropriate requirements can be made to either avoid the bedrock or provide monitoring during excavation. As these provisions are already in place or would be applied as part of either the

Minor or Conditional Use Permit, there is no need for mitigation. This impact is considered less than significant (Class III).

Cause a Substantial Adverse Change in the Significance of a Paleontological Resource – Policy Changes (pp. 3.5-29 through -30)

The proposed policy changes would streamline the construction of rooftop SEFS and WECS projects that could not have any impact on paleontological resources. The proposed Program also allows for streamlining of ground-mounted equipment and includes a performance standard that either directs this equipment to previously disturbed areas or requires preparation of a cultural and paleontological resources analysis. This impact would be less than significant (Class III).

#### Findings:

The County finds, based on the Draft EIR, the Final EIR, and the whole of the record, that the proposed Program will result in less than significant impacts associated with impacts to historical resources (solar, wind, and policy changes); impacts to archaeological resources (solar, wind, and policy changes); disturbance of any human remains including those interred outside formal cemeteries (solar, wind, and policy changes); and impacts to paleontological resources (solar, wind, and policy changes).

#### 6.6 GEOLOGY AND SOILS

Expose People or Structures to Potential Substantial Adverse Effects, Including the Risk of Loss, Injury, or Death Involving Rupture of a Known Earthquake Fault (as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map), Strong Seismic Ground Shaking, Seismic-Related Ground Failure, Including Liquefaction, or Landslides or Be Located on a Geologic Unit or Soil That Is Unstable, or That Would Become Unstable as a Result of the Project, and Potentially Result in On- or Off-Site Landslide, Lateral Spreading, Subsidence, Liquefaction, or Collapse – Solar (pp. 3.6-18 through -19)

Two Alquist-Priolo Special Earthquake Study Zone Faults traverse the county—the San Andreas and the Los Osos fault zones. Because these two fault zones are Alquist-Priolo faults, there is a potential for surface ground rupture during a seismic event along these segments. Development of solar electric facility (SEF) projects could result in structures being placed and maintained within an Earthquake Fault Zone. However, these structures would not be designed for human occupancy and would not place people at risk of surface rupture or other seismic hazards. In the event that solar panels and associated infrastructure are placed within an Earthquake Fault Zone, Geologic Study Area (GSA) performance standards would apply and a geology and soils report would be required. Structures would be designed, engineered, and installed to avoid or withstand surface rupture or other seismic hazards. Additionally, it should be noted that the RESP would not negate or supersede the requirements of the Alquist-Priolo Earthquake Fault Zoning Act.

Development of SEFs in the county, whether roof- or ground-mounted, would be designed in accordance with California Building Code (CBC) requirements that address structural seismic safety. All new development would be required to comply with the CBC, which includes design criteria for seismic loading and other geologic hazards, including design criteria for geologically induced loading that govern sizing of structural members and provide calculation methods to assist in the design process and mounting and installation requirements for rooftop solar panels specific to roof types. Thus, while shaking impacts would be potentially damaging, they would also tend to be reduced in their structural effects due to CBC criteria that recognize this potential. The

CBC includes provisions for buildings to structurally survive an earthquake without collapsing and includes measures such as anchoring to the foundation and structural frame design.

Conformance with GSA performance standards, including engineered grading plan requirements where applicable, would reduce impacts related to unstable earth conditions to less than significant (Class III).

Expose People or Structures to Potential Substantial Adverse Effects, Including the Risk of Loss, Injury, or Death Involving Rupture of a Known Earthquake Fault (as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map), Strong Seismic Ground Shaking, Seismic-Related Ground Failure, Including Liquefaction, or Landslides or Be Located on a Geologic Unit or Soil That Is Unstable, or That Would Become Unstable as a Result of the Project, and Potentially Result in On- or Off-Site Landslide, Lateral Spreading, Subsidence, Liquefaction, or Collapse – Wind (p. 3.6-19)

Construction and operation of wind energy conversion system (WECS) projects would not place structures within an Alquist-Priolo Earthquake Fault Zone, would not produce unstable earth conditions, and would not expose people or structures to unstable earth conditions. Only Tier 1 WECS, which would be mounted on a rooftop or existing structure, would be streamlined under this Program. No soil disturbance or excavation would occur, and the WECS would be mounted on structures that were sited and constructed in conformance with the California Building Code.

In the event that WECs projects and associated infrastructure are proposed within an Earthquake Fault Zone, GSA performance standards would apply and a geology and soils report would be required. Structures would be designed, engineered, and installed to avoid or withstand surface rupture or other seismic hazards. Additionally, it should be noted that the proposed Program would not negate or supersede the requirements of the Alquist-Priolo Earthquake Fault Zoning Act.

Development of WECs in the county, whether roof- or ground-mounted, would be designed in accordance with CBC requirements that address structural seismic safety. All new development would be required to comply with the CBC, which includes design criteria for seismic loading and other geologic hazards. As such, the impact would be less than significant (Class III).

Expose People or Structures to Potential Substantial Adverse Effects, Including the Risk of Loss, Injury, or Death Involving Rupture of a Known Earthquake Fault (as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map), Strong Seismic Ground Shaking, Seismic-Related Ground Failure, Including Liquefaction, or Landslides or Be Located on a Geologic Unit or Soil That Is Unstable, or That Would Become Unstable as a Result of the Project, and Potentially Result in On- or Off-Site Landslide, Lateral Spreading, Subsidence, Liquefaction, or Collapse – Policy Changes (pp. 3.6-19 through -20)

The proposed RE Combining Designation overlaps large portions of the GSA Combining Designation in the county. The GSA Combining Designation indicates areas subject to increased risk from seismic activity, landslides, and/or liquefaction. However, for areas where the proposed RE Combining Designation overlaps with a GSA, all performance standards for that GSA would continue to apply under the proposed Program. Specifically, streamlined Tier 2 and Tier 3 SEF projects would be subject to engineered grading plan requirements to reduce risks to structures, life, and property from unstable/hazardous earth conditions.

The Program would not negate or supersede the requirements of the Alquist-Priolo Earthquake Fault Zoning Act. No structures designed for human occupancy would be placed within a

California Geological Survey Earthquake Fault Zone. For areas where the RE Combining Designation overlaps with a GSA, all performance standards for that GSA would continue to apply under the proposed Program. The proposed Program would not result in any policy changes that would increase the likelihood of a structure being placed within an Earthquake Fault Zone, nor would the RESP change any of the existing requirements for an unoccupied structure that is placed within an Earthquake Fault Zone.

Similarly, requirements of the CBC would continue to apply to all projects proposed under the Program throughout the county. Additionally, the Program does not pertain to the development of structures designed for human occupancy. Therefore, impacts related to unstable earth conditions would be less than significant (Class III).

### Result in Substantial Soil Erosion or the Loss of Topsoil – Solar (p. 3.6-20)

Construction activities for SEFs could lead to topographic changes within the project area. These topographic modifications, if improperly designed, could lead to soil erosion, loss of topsoil, and/or unstable soil conditions. However, all SEFs disturbing more than 50 cubic yards of material or removing more than 1 acre of vegetation would be subject to the County's grading permit requirements (Chapter 22.52 of the County Code), which establish standards to minimize erosion and sedimentation, reduce the harmful effects of stormwater runoff, and otherwise protect the natural environment. Grading permit requirements include submittal of a grading plan and erosion and sedimentation control plan (existing LUO Section 22.52.120), including protective measures to be taken during construction to prevent erosion of the cut faces of excavations or of the sloping surfaces of fills. If necessary, a civil engineering report, soil engineering report, and/or engineering geology report could also be required.

In addition, COSE Policies SL 1.2 and SL 1.3 recommend that erosion and sediment control practices are implemented on steep slopes, natural vegetation and topography are retained to the maximum extent feasible in areas designated with at least moderate erosion potential, degraded and eroded areas are restored where feasible by replanting with native vegetation, grading and site disturbance is avoided on slopes over 30 percent, and projects are designed to minimize runoff. Additionally, the retention of natural drainage systems is encouraged. Further, under the proposed Program, sites graded and cleared of natural vegetation and topsoil during construction are required to be restored (regraded, covered with topsoil, and replanted) once those disturbed areas are no longer required for operation (proposed LUO Section 22.32.040.A.3). Soil removed during construction must be stored for later use. Therefore, adherence to the Land Use Ordinance, COSE Policies SL 1.2 and SL 1.3, and proposed LUO Section 22.32.040.A.3 would reduce impacts to less than significant (Class III).

### Result in Substantial Soil Erosion or the Loss of Topsoil – Wind (pp. 3.6-20 through -21)

Construction and operation of WECS would not increase soil erosion or lead to unstable soils. Only Tier 1 WECS, which would be mounted on a rooftop or existing structure, would be streamlined under this program. No grading, excavation, or filling would occur. Impacts would be less than significant (Class III).

#### Result in Substantial Soil Erosion or the Loss of Topsoil – Policy Changes (p. 3.6-21)

For areas where the RE Combining Designation overlaps with a GSA, all performance standards for the Geologic Study Area would continue to apply under the proposed Program. Similarly, requirements of the CBC would continue to apply to all projects streamlined under the proposed Program. Additionally, the proposed Program does not negate or conflict with any County

General Plan COSE soil conservation requirements to preserve and protect soil resources from degradation or loss by wind and water erosion. COSE Policy SL 1.2 requires erosion and sedimentation control practices during development or other soil-disturbing activities on steep slopes and ridgelines, while Policy SL 1.3 requires that grading and site disturbance on slopes greater than 30 percent be avoided. Therefore, compliance with General Plan COSE policies and adherence to CBC requirements and the requirements in the Land Use Ordinance for Geologic Study Areas would reduce effects associated with the implementation of the proposed Program and would not result in increased soil erosion or unstable soils. The impact would be less than significant (Class III).

#### Be Located on Expansive Soil, Creating Substantial Risks to Life or Property – Solar (p. 3.6-21)

The county has 134,221 acres of soil with a high shrink-swell potential, located primarily in the lower elevations of the coastal regions of the county. The North County Planning Area has the highest number of acres with high shrink-swell potential, with approximately 66,000 acres of these soils. The South County Planning Area contains approximately 26,000 acres of soils with high shrink-swell potential, followed by the San Luis Obispo Planning Area with approximately 18,000 acres. The Carrizo Planning Area has the lowest number of acres with expansive soils with a high shrink-swell potential, approximately 14,000 acres.

Construction and operation of ground-mounted SEFs could result in structures being placed and maintained on expansive soils. These structures would not be designed for human occupancy and would not place people at risk of geologic hazards. Under the RESP, requirements of the California Building Code would continue to apply to all streamlined projects, and structures located on expansive soils would be designed and engineered to withstand the shrink-swell forces of expansive soils. Although Tier 3 SEFs would include a greater number of structures than Tier 1 and Tier 2 SEFs, the risk of exposure to geologic hazards would be the similar and would remain less than significant. Conformance with California Building Code requirements, which would apply to all streamlined SEFs, would reduce the risk of exposure to geologic hazards (including expansive soils) to less than significant (Class III).

#### Be Located on Expansive Soil, Creating Substantial Risks to Life or Property – Wind (p. 3.6-22)

Construction and operation of WECS would not place structures on expansive soils. Only Tier 1 WECS, which would be mounted on a rooftop or existing structure, would be streamlined under this Program. Therefore, WECS would not be placed on expansive soils, and no impacts under this threshold would occur as a result of streamlined WECS. This impact is less than significant (Class III).

# Be Located on Expansive Soil, Creating Substantial Risks to Life or Property – Policy Changes (p. 3.6-22)

The Program would not negate or supersede the requirements of the California Building Code. No structures designed for human occupancy would be constructed under the proposed Program. The proposed RESP would not result in any policy changes that would increase the likelihood of a structure being placed on expansive soils, nor would the proposed Program change any of the existing requirements for an unoccupied structure that is placed on expansive soils. Therefore, this impact is less than significant (Class III).

Be Inconsistent with the Goals and Policies of the County's Safety Element Relating to Geologic and Seismic Hazards – Solar (p. 3.6-22)

Construction and operation of SEFs would not produce unstable earth conditions. Conformance with GSA performances, which would apply to all streamlined SEFs within a Geologic Study Area, would reduce the risk of exposure to unstable earth conditions to less than significant. In the event solar panels and associated infrastructure are placed within an Earthquake Fault Zone, GSA performance standards would apply and engineered grading would be required. Structures would be designed, engineered, and installed to avoid or withstand surface rupture or other seismic hazards. Although Tier 3 SEFs would include a greater number of structures than Tier 1 and Tier 2 SEFs, the risk of exposure to unstable earth conditions or surface rupture and other seismic hazards would be the similar and would remain less than significant (Class III).

## Be Inconsistent with the Goals and Policies of the County's Safety Element Relating to Geologic and Seismic Hazards – Wind (pp. 3.6-22 through -23)

Construction and operation of WECS would not produce unstable earth conditions and would not expose people or structures to unstable earth conditions. Construction and operation of WECS would not place structures built for human occupancy within an Earthquake Fault Zone. Only Tier 1 WECS, which would be mounted on a rooftop or existing structure, would be streamlined under this program. No soil disturbance or excavation would occur, and the WECS would be mounted on structures that were sited and constructed in conformance with the California Building Code. Exposure to unstable earth conditions or surface rupture would not occur within any of the planning areas, and this impact is considered less than significant (Class III).

# Be Inconsistent with the Goals and Policies of the County's Safety Element Relating to Geologic and Seismic Hazards – Policy Changes (p. 3.6-23)

For areas where the RE Combining Designation overlaps with a GSA, all performance standards for that Geologic Study Area would continue to apply under the proposed Program. Similarly, requirements of the Alquist-Priolo Fault Zoning Act and the California Building Code would continue to apply to all projects streamlined under the proposed Program. Additionally, the proposed Program does not pertain to the development of structures designed for human occupancy. Therefore, implementation of the proposed Program would not result in actions or projects that are inconsistent with the County's Safety Element relating to geologic and seismic hazards. This impact is considered less than significant (Class III).

### Preclude the Future Extraction of Valuable Mineral Resources – Solar (p. 3.6-23)

Although SEFs could occupy up to 160 acres, they would be subject to the LUO requirements of the Energy and Extractive Resource Area (EX) and Extractive Resource Area (EX1) combining designations. These requirements would ensure that SEFs are not sited in locations that are reserved or zoned for present or future mineral resource extraction. Therefore, SEFs would not preclude the future extraction of valuable mineral resources. Less than significant (Class III) impacts would occur under this threshold as a result of streamlined SEFs.

#### Preclude the Future Extraction of Valuable Mineral Resources – Wind (p. 3.6-24)

Construction and operation of WECS would not place structures on mineral resource extraction lands. Only Tier 1 WECS, which would be mounted on a rooftop or existing structure, would be streamlined under this Program. Therefore, WECS would not preclude the future extraction of valuable mineral resources. Less than significant (Class III) impacts under this threshold would occur as a result of streamlined WECS.

#### Preclude the Future Extraction of Valuable Mineral Resources – Policy Changes (p. 3.6-24)

The RESP would not negate or supersede the performance standards of the EX or EX1 combining designations. No structures would be sited on lands reserved or zoned for mineral resource extraction under the proposed Program. The proposed Program would not result in any policy changes that would preclude the future extraction of valuable mineral resources. Therefore, this impact is less than significant (Class III).

#### Findings:

The County finds, based on the Draft EIR, the Final EIR, and the whole of the record, that the proposed Program will result in less than significant impacts associated with potential fault rupture along faults identified as Alquist-Priolo fault systems or segments (solar, wind, and policy changes); the substantial loss of topsoil (solar, wind, and policy changes); inconsistency with the goals of the County's Safety Element relating to geologic and seismic hazards (solar, wind, and policy changes); and mineral resources (solar, wind, and policy changes).

### 6.7 Greenhouse Gases and Climate Change

## Generate Greenhouse Gas Emissions That Exceed Thresholds as Established by the County Air Pollution Control District – Solar/Wind (pp. 3.7-17 through -18)

Solar energy projects developed under the Program would include solar photovoltaic panels mounted on rooftops of other structures as well as small to medium-sized ground-mounted systems. The proposed Program would also allow WECS facilities that are mounted to rooftops of existing structures. The development of such facilities would result in direct emissions of GHGs from construction. While some GHG emissions would be generated during the operation of renewable energy facilities from worker trips and equipment usage associated with ongoing operations, maintenance, repair, and security, such emissions would be negligible. As stated in Section 2.0, Project Description, of the Draft EIR, it is likely that up to three personnel would be required to service and maintain each Tier 1 SEF, Tier 2 SEF, and Tier 3 SEF facility, which represents levels well below thresholds established by the SLOAPCD.

The total land footprint assumed for development of these projects is 1,500 acres. For the purposes of this analysis, it is assumed that development of these 1,500 acres would occur over a period of 10 years. Predicted maximum construction-generated emissions are summarized in Table 3.7-5 of Draft EIR Section 3.7, Greenhouse Gases and Climate Change, and compared with the SLOAPCD significance threshold for GHG emissions. In accordance with the SLOAPCD threshold determination, projected GHGs from construction activities have been amortized over the life of project operations (30 years). The projected criteria pollutant emissions resulting from construction activities were estimated by PMC using the California Emissions Estimator Model (CalEEMod). Results of the modeling conducted by PMC are included in Appendix 3.3 and 3.7 of the Draft EIR.

As shown, construction-generation GHG emissions, amortized over the life of the project per SLOAPCD guidance, would not surpass SLOAPCD significance thresholds; therefore, the impact would be less than significant (Class III). In addition, renewable energy-generating facilities reduce emissions by decreasing the need for energy from fossil fuel-based power plants throughout the state. The GHG emissions reduction realized by operation of the SEF and WECS facilities allowed under the project would more than offset the GHG emissions generated by their construction and ongoing operations. Further, EnergyWise Plan Reduction Measure 10 calls for the development of a comprehensive renewable energy strategy to encourage the commercial-scale installation of renewable energy projects in the county. The proposed Program would directly implement

Reduction Measure 10, which according to the County EnergyWise Plan will reduce GHG emissions by 20,610 to 41,290 metric tons annually by the year 2020. Therefore, this impact is less than significant (Class III).

Findings:

The County finds, based on the Draft EIR, the Final EIR, and the whole of the record, that the proposed Program will result in less than significant impacts associated with the generation of greenhouse gas emissions that exceed thresholds established by the County Air Pollution District (solar/wind).

### 6.8 HAZARDS AND HAZARDOUS MATERIALS

Create a Hazard to the Public or the Environment Through the Routine Transport, Use, or Disposal of Hazardous Materials – Construction (pp. 3.8-17 through -18)

The Program would include construction activities that could involve limited transport, use, and disposal of hazardous materials routinely associated with the operation and maintenance of heavy construction equipment or other support vehicles, such as gasoline fuels, asphalt, lubricants, toxic solvents, pesticides, dust palliatives, and herbicides. The use and handling of hazardous materials during construction activities would be required to occur in accordance with applicable federal, state, and local laws.

While the potential exists for these materials to be leaked or accidentally spilled onto the ground or into waterways during construction and create a hazard to the public or the environment, such spills would be anticipated to be minor based on the quantity of such materials typically stored and/or used on a construction site for Tier 1, Tier 2, and Tier 3 projects. If the project were to use or store larger quantities of hazardous materials, it would be subject to the existing San Luis Obispo Certified Unified Program Agency (CUPA) hazardous materials business plan requirements, reducing the impact to less than significant. Statewide, the California Department of Toxic Substances Control (DTSC) has primary regulatory responsibility for management of hazardous materials, with delegation of authority to local jurisdictions that enter into agreements with the State.

Furthermore, all construction sites disturbing more than 50 cubic yards of material or removing more than 1 acre of vegetation would be subject to the County's grading permit requirements (Chapter 22.52 of the County Code), which establish standards to, among other things, prevent contaminants, sediments, and/or pollutants from leaving construction sites. In addition, potential impacts related to minor spills would be largely avoided by training construction personnel in the handling and storage of hazardous materials in compliance with Occupational Safety and Health Administration (OSHA) standards, which require construction projects to implement safe hazardous material handling and storage, transfer (e.g., refueling), and maintenance (e.g., oil changes, washing). These existing regulations would ensure that the transport, use, and disposal of hazardous materials during solar or wind facility construction activities would not create a significant hazard to the public or the environment. This impact would be less than significant (Class III).

Create a Hazard to the Public or the Environment through the Routine Transport, Use, or Disposal of Hazardous Materials – Solar (pp. 3.8-18 through -19)

Cadmium telluride (CdTe) may be present in photovoltaic solar panels used for solar energy projects. CdTe is considered toxic if ingested or inhaled via dust particles. Human exposure to CdTe would occur only if a module, sealed in glass, generated flake or dust particles. The

potential for CdTe release could only occur from severe pitting of the panel surface. In addition, some high-performance solar photovoltaic cells contain small amounts of selenium and arsenic, which could be emitted if solar cells were broken during construction or decommissioning.

For photovoltaic facilities using high-performance solar cells, special handling of solar panels containing toxic metals would be required to prevent accidental breakage that would also preclude recycling of the solar cell materials at off-site facilities. Any modules that are damaged/broken or found to be defective for any reason (during construction or operations) would be returned to the manufacturing facility for recycling, consistent with California (i.e., retrograde material) and federal requirements, where they would be recycled into new modules or for use in other new products.

As described in the proposed changes to Chapter 22.32, all renewable energy facilities land use permit applications will be required to submit a recycling and disposal plan that would address both construction and operations of the solar electric facility (SEF) project for renewable energy infrastructure, including photovoltaic panels, so that project structures do not pose a risk to human health or the environment. The recycling and disposal plan is required to specify how project components will be disposed of in a manner that will not pose a risk to human health or the environment.

SEF projects that deal with storage, use, and disposal of hazardous materials in all County planning areas would comply with all appropriate federal, state, and local regulations, such as the regulations discussed in Section 3.8, Hazards and Hazardous Materials, subsection 3.8.2, Regulatory Setting, of the Draft EIR, to ensure safety of the surrounding public and environment. These requirements would reduce this impact to less than significant (Class III).

## Create a Hazard to the Public or the Environment through the Routine Transport, Use, or Disposal of Hazardous Materials – Wind (p. 3.8-19)

Construction and decommissioning of wind facilities would generate both solid and minor liquid wastes. Fluids used and drained from turbine drive train components (e.g., lubricating oils, hydraulic fluids, coolants) require disposal. Tower segments, turbine components (emptied of their fluids), and broken concrete would not pose a hazardous materials risk and could be recycled or reused. Miscellaneous materials without salvage value are expected to be nonhazardous and would be sent to permitted disposal facilities.

Because the RESP only streamlines Tier 1 wind energy projects, the amount of hazardous materials used, transported, or disposed of for these projects would be anticipated to be minor. Similarly, the amount of waste produced when decommissioning Tier 1 wind energy conversion systems (WECS) would be minor due to the size of rooftop wind projects. Similar to SEF projects, Tier 2 WECS projects would be required to comply with all appropriate federal, state, and local regulations, such as the regulations discussed in Draft EIR Section 3.8, Hazards and Hazardous Materials, subsection 3.8.2, Regulatory Setting, to ensure safety of the surrounding public and environment. Because of the size of Tier 1 WECS and the standard requirements for building all WECS projects, this impact would be less than significant (Class III).

## Create a Hazard to the Public or the Environment through the Routine Transport, Use, or Disposal of Hazardous Materials – Policy Changes (p. 3.8-20)

The proposed Program does not alter existing local, state, or federal regulations or policies pertaining to transport, use, or disposal of hazardous materials. Projects implemented under the Program would result in less than significant (Class III) impacts.

Create a Hazard to the Public or the Environment Through Reasonably Foreseeable Upset and Accident Conditions Involving the Release of Hazardous Materials into the Environment – Solar (pp. 3.8-20 through -21)

According to the GeoTracker database (see Table 3.8-1 in the Draft EIR), there are currently 39 cleanup sites in the county. In the absence of appropriate precautions and/or cleanup efforts, certain projects may create the potential for exposing construction workers, the public, or the environment to hazardous materials.

Where appropriate, the County would require an investigation of the potential for SEF projects that are located at or in the vicinity of identified hazardous material sites or in areas that contain hazardous materials. Site-specific evaluation would have to include a historical assessment of past uses, and when determined appropriate by the County, soil sampling. In those instances where a specific project site is found to be contaminated by hazardous materials, the site would be required, where appropriate, to be cleaned up to the standards of the appropriate regulatory agency. Appropriate remediation measures to ensure worker safety during construction would be required, where appropriate, prior to the commencement of earthmoving activities, subject to the County's review and approval.

Tier 1, 2, and 3 SEF projects could also occur in areas with the valley fever fungus (Coccidioides immitis). Project construction would disturb the soil and cause the fungal spores to potentially become airborne, potentially putting construction personnel and wildlife at risk of contracting valley fever. As discussed in Draft EIR Section 3.3, Air Quality, infection from valley fever during construction can be avoided through the control of construction-generated dust. Construction-generated dust associated with the project would be controlled by adhering to the requirements contained in existing County Code Section 22.52.160 and would ensure that impacts associated with valley fever would be addressed. Additionally, other actions can be implemented by project contractors during construction such as wetting the soil before disturbing it by heavy equipment or vehicles and wetting soils continuously while digging in order to keep dust levels down would help to prevent the fungal spores associated with valley fever from becoming airborne. For these reasons, this impact is considered less than significant (Class III).

Create a Hazard to the Public or the Environment Through Reasonably Foreseeable Upset and Accident Conditions Involving the Release of Hazardous Materials into the Environment – Wind (p. 3.8-21)

Construction and operation of Tier 1 WECS would be small in scale and located on existing roofs or structures. They would not result in ground disturbance to areas that may previously have been contaminated but may result in disturbance to roofing shingles that could contain asbestos. Prior to installation of a Tier 1 WECS, studies assessing the structure's roof would be required. Any roofing shingles with asbestos would be identified, and existing regulations, such as 8 California Code of Regulations (CCR) Section 339, would require that this hazardous material be addressed prior to any construction, reducing the impact to less than significant.

The transport of Tier 1 WECS would involve minimal hazardous materials and so would be unlikely to result in accidental release of such materials. Any risk of hazard to the public through the reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment would be considered less than significant (Class III).

Create a Hazard to the Public or the Environment Through Reasonably Foreseeable Upset and Accident Conditions Involving the Release of Hazardous Materials into the Environment – Policy Changes (p. 3.8-21)

Adherence to existing regulations, as well as to policy changes proposed under the RESP, would ensure that solar and wind projects are required to comply with all appropriate federal, state, and local regulations, such as the regulations discussed in Draft EIR Section 3.8, Hazards and Hazardous Materials, subsection 3.8.2, Regulatory Setting, to ensure the safety of the surrounding public and environment. The Program would not indirectly create a hazard to the public through the accidental release of hazardous materials. This impact is considered a less than significant (Class III).

Emit Hazardous Emissions or Handle Hazardous or Acutely Hazardous Materials, Substances, or Waste within One-Quarter Mile of an Existing or Proposed School – Solar (pp. 3.8-22 through -23)

The exact location of the Tier 1, 2, and 3 SEF projects are unknown so there is a possibility that some projects would be within one-quarter mile of an existing or proposed school. However, all renewable energy facilities would comply with all appropriate federal, state, and local regulations to ensure the safety of the surrounding public and environment. For instance, a business plan that includes an inventory of hazardous materials handled, facility floor plans showing where hazardous materials are stored, an emergency response plan, and provisions for employee training in safety and emergency response procedures (California Health and Safety Code, Division 20, Chapter 6.95, Article 1) would be required for each individual project.

In terms of the potential hazards of CdTe, the CdTe contained in PV modules is in the environmentally stable form of a compound rather than the leachable form of a metal. The module design results in the encapsulation of the semiconductor material between two sheets of glass, thereby preventing the exposure of CdTe to the environment. Furthermore, any modules that are damaged/broken or found to be defective for any reason (during construction or operations) would be returned to the manufacturing facility for recycling, consistent with California (i.e., retrograde material) and federal requirements, where they would be recycled into new modules or for use in other new products.

As described in the proposed changes to Chapter 22.32, all land use permit applications for renewable energy facilities will be required to submit a recycling and disposal plan that would address both construction and operations of the SEF project for renewable energy infrastructure. The recycling and disposal plan is required to specify how project components will be disposed of in a manner that will not pose a risk to human health or the environment. Therefore, the risk of emissions of acutely hazardous materials in the vicinity of a school would be less than significant.

Students at nearby schools could be significantly impacted if a spill of motor vehicle fuel or transformer fluid were to occur as a result of transportation of these materials to the site for project construction. However, all construction sites disturbing more than 50 cubic yards of material or removing more than 1 acre of vegetation would be subject to the County's grading permit requirements (Chapter 22.52 of the County Code), which establish standards to, among other things, prevent contaminants, sediments, and/or pollutants from leaving construction sites. The grading permit requirements set forth standards, including the incorporation of best management practices (BMPs) to control all grading, excavation, and earthwork and would ensure that hazardous or flammable materials used during construction of solar or wind facilities would not create a significant hazard to the public.

Potential impacts related to minor spills would be largely avoided by training construction personnel in the handling and storage of hazardous materials in compliance with OSHA standards, which require construction projects to implement safe hazardous material handling and storage, transfer (e.g., refueling), and maintenance (e.g., oil changes, washing). In addition, the transport of large quantities of hazardous materials is strictly regulated by the California Highway Patrol (California Vehicle Code Section 3200.5), and the hazardous materials used during project construction would be transported along regulated routes by a licensed transporter and would therefore not pose a significant hazard to students at schools. This impact is considered less than significant (Class III).

Emit Hazardous Emissions or Handle Hazardous or Acutely Hazardous Materials, Substances, or Waste Within One-Quarter Mile of an Existing or Proposed School – Wind (p, 3.8-23)

Construction and operation of Tier 1 WECS could be located within one-quarter mile of existing and proposed schools. Tier 1 WECS would be small in scale and located on existing roofs or structures. Construction of Tier 1 WECS would emit minimal hazardous materials, given the size and type of roof-mounted structures. Any risk of emitting hazard materials within one-quarter mile of an existing or proposed school would be minimal and less than significant (Class III).

Emit Hazardous Emissions or Handle Hazardous or Acutely Hazardous Materials, Substances, or Waste Within One-Quarter Mile of an Existing or Proposed School – Policy Changes (p. 3.8-23)

Adherence to policy changes proposed under the RESP would ensure that solar and wind projects are required to comply with all appropriate federal, state, and local regulations, such as the regulations discussed in Draft EIR Section 3.8, Hazards and Hazardous Materials, subsection 3.8.2, Regulatory Setting, to ensure the safety of the surrounding public and environment. Any impacts would be reduced to less than significant (Class III) levels and so would not indirectly create a hazard to the public through the accidental release of hazardous materials.

Be Located on, or Adjacent to, a Site Which Is Included on a List of Hazardous Material/Waste Sites Compiled Pursuant to Government Code Section 65962.5 (Cortese List) and Result in an Adverse Public Health Condition – Solar (pp. 3.8-23 through -24)

The Cortese List includes hazardous waste facilities, contaminated drinking water wells, sites listed as having underground storage tank leaks that have discharged into surface water or groundwater, and other sites that have had a known migration of hazardous materials or waste (see Table 3.8-1 of the Draft EIR). Many of the sites listed in Table 3.8-1 are located in incorporated cities and would not be within the Combining Designation overlay.

However, while unlikely, some of the Tier 1, Tier 2, or Tier 3 SEF sites could be within or adjacent to an overlay site identified on the Cortese List and could therefore result in potentially adverse public health conditions. Even so, these sites are well regulated per federal and state laws. Where appropriate, the County would require an investigation of the potential for SEF projects to be located at or in the vicinity of identified hazardous material sites or to be located in areas that contain hazardous materials.

Any future development of solar projects built on sites that are on the Cortese List would be required to comply with all California, federal, and local laws and regulations intended to prevent adverse public health conditions associated with these sites. For instance, lands identified on the Cortese List could be required to be cleaned up to the standards of the appropriate regulatory agency before the site can be developed. Appropriate remediation measures to ensure worker safety during construction would be required, where appropriate,

prior to the commencement of earthmoving activities, subject to the County's review and approval. Therefore, this impact is less than significant (Class III).

Be Located on, or Adjacent to, a Site Which Is Included on a List of Hazardous Material/Waste Sites Compiled Pursuant to Government Code Section 65962.5 (Cortese List) and Result in an Adverse Public Health Condition – Wind (p. 3.8-24)

Construction and operation of Tier 1 WECS would be small in scale and located on existing roofs or structures. While it is unlikely that they would be located on a building that is on the Cortese List, any future development of WECS projects built on sites that are on the Cortese List would be required to comply with all California, federal, and local laws and regulations intended to prevent adverse public health conditions associated with these sites. For instance, lands identified on the Cortese List could be required to be cleaned up to the standards of the appropriate regulatory agency before the site can be developed. Therefore, this impact is less than significant (Class III).

Be Located on, or Adjacent to, a Site Which Is Included on a List of Hazardous Material/Waste Sites Compiled Pursuant to Government Code Section 65962.5 (Cortese List) and Result in an Adverse Public Health Condition – Policy Changes (p. 3.8-24)

As discussed above, any development of SEF and WECS projects built on sites that are on the Cortese List would be required to comply with all California, federal, and local laws and regulations intended to prevent adverse public health conditions associated with these sites. Therefore, this impact is less than significant (Class III).

Impair Implementation of or Physically Interfere with an Adopted Emergency Response Plan or Evacuation Plan – Solar (pp. 3.8-24 through -25)

Response corridors and evacuation routes are roadways that would typically be used by response vehicles or the general public in an emergency situation. These roadways are generally arterials and other major roadways that offer sufficient width for emergency response vehicles. Tier 1, Tier 2, and Tier 3 SEFs would not impair the implementation of plans to access these routes or directly interfere with access to them. Any construction-related traffic generated during the construction of SEFs would be limited in both scope and duration. The projects would be required to identify responsibilities and coordinate emergency responses at the local level in the event of an emergency. Furthermore, the operation of SEFs would not result in a substantial concentration of people in one area and therefore would not affect existing response plans. Therefore, this impact would be less than significant (Class III).

Impair Implementation of or Physically Interfere with an Adopted Emergency Response Plan or Evacuation Plan – Wind  $(p.\ 3.8\text{-}25)$ 

Construction and operation of Tier 1 WECS would be small in scale and located on existing roofs or structures. It is unlikely that they would impair implementation of or physically interfere with an adopted emergency response plan or an evacuation plan. Any construction traffic generated during the construction of Tier 1 WECS would be short term in nature, would likely be one or two vehicles, and would not generate interference with an emergency response plan. Therefore, this impact is less than significant (Class III).

## Impair Implementation of or Physically Interfere with an Adopted Emergency Response Plan or Evacuation Plan – Policy Changes (p. 3.8-25)

Policy changes proposed under the RESP would not affect response corridors and/or evacuation routes. Less than significant (Class III) impacts would occur.

## If Within the Airport Review Designation or Near a Private Airstrip, Result in a Safety Hazard for People Residing or Working in the Project Area – Solar (pp. 3.8-25 through -26)

Tier 1, Tier 2, or Tier 3 SEFS could be built at adjacent to or near existing airports. Low-flying planes and helicopters could be subject to glare from the reflective surfaces of the solar PV glass panels during daylight hours. Because of the potential footprint of PV arrays, up to 160 acres for Tier 3 SEFs, pilots could potentially experience distracting flashes of reflected light while flying in the immediate vicinity of a solar project.

While such glare would be a new feature in the project area, PV installations at airports typically incorporate anti-reflective coatings in the panels to minimize the effects of glare on aeronautical operations. In addition, existing objectives would prohibit any development within the Paso Robles Municipal Airport and the San Luis Obispo County Regional Airport, which have conditions that pose hazards to aircraft in flight (see Paso Robles Municipal Airport Land Use Plan, Objective 4.6.1, and San Luis Obispo Municipal Airport Land Use Plan, Objective 4.5.1).

Paso Robles Municipal Airport Land Use Plan Policy S-5 and San Luis Obispo County Regional Airport Land Use Plan Policy S-4 would not allow high-intensity or unusually hazardous land uses within the area under the Airport Land Use Plan's jurisdiction. Further, the Federal Aviation Administration's (FAA) interim policy would require FAA review of solar energy projects on federally obligated airports, and 14 Code of Federal Regulations (CFR) Part 77 would require notification of any structures within 20,000 feet of an airport. With implementation of the existing rules and regulations regarding airports and private airstrips, impacts that could result in a safety hazard for people residing or working in the project area would be less than significant (Class III).

# If Within the Airport Review Designation or Near a Private Airstrip, Result in a Safety Hazard for People Residing or Working in the Project Area – Wind (p. 3.8-26)

Construction and operation of Tier 1 WECS would be small in scale and located on existing roofs or structures. The height restriction for Tier 1 WECS is 10 feet in areas designated for agriculture, rural, and public facilities land uses, and up to 15 feet in all other land use categories. Because the Tier 1 WECS would be built on existing structures and would be limited in height, impacts within or adjacent to airport and private airstrips would be less than significant (Class III). Additionally, Paso Robles Municipal Airport Land Use Plan Policy S-5 and San Luis Obispo County Regional Airport Land Use Plan Policy S-4 would not allow high-intensity or unusually hazardous land uses within the area under the Airport Land Use Plan's jurisdiction.

## If Within the Airport Review Designation or Near a Private Airstrip, Result in a Safety Hazard for People Residing or Working in the Project Area – Policy Changes (p. 3.8-26)

Adherence to existing policies and other policy changes proposed under the RESP would ensure streamlined solar and wind projects comply with San Luis Obispo County ordinances and applicable General Plan strategies, measures, and policies, including those in the Conservation and Open Space Element. This impact would be less than significant (Class III).

# Increase Fire Hazard Risk or Expose People or Structures to High Wildland Fire Hazard Conditions – Solar (pp. 3.8-26 through -27)

Project construction would involve the use of heavy equipment, welding, and other activities, including personnel smoking, which could cause a wildfire ignition at the site, potentially resulting in a hazard to personnel or to the scattered residences in the vicinity of the solar energy project. In addition, electrical fires from equipment during the operations phase of the project could ignite nearby vegetation. Switching equipment and inverters would be sited on concrete foundations, and inverters would be housed in steel and concrete equipment enclosures, minimizing the risk of electrical sparks that could ignite vegetation during equipment failure. All electrical equipment would be built to industry safety design standards, further reducing the risk of electrical fires at the site. PV array wiring may remain "hot," i.e., carry an electrical charge, after being disconnected during daylight hours. If PV panels are disconnected by trespassers, operations personnel, or during dismantling, live wires could result in a wildfire ignition if they were to come into contact with vegetation. In addition, live wires could pose an electric shock hazard to trespassers or authorized personnel.

Although the characteristics of the Tier 1, Tier 2, and Tier 3 SEF projects present only a moderate fire hazard, during extreme weather conditions, a fire originating at the solar sites could spread out of control and pose a risk to life and property within the RE Combining Designation overlays. Any loss of life or property as a result of an accidental wildfire ignition would be a significant impact. The risk of ignition from project activities could be reduced or eliminated by implementing additional fire safety practices during construction and site operation as required by County Code Chapter 22.50, Fire Safety Plan. Fire safety plans generally are reviewed by the County fire protection agency and include measures to prevent accidental ignition at the site. In addition, proposed LUO Section 22.32.040.A.5 would require electrical safety signage on all arrays in the immediate vicinity of all wiring and all electrical conduits to reduce the risk of electrical shock and fire. Through implementation of these standards and policies, impacts related to wildfire would be less than significant (Class III).

## Increase Fire Hazard Risk or Expose People or Structures to High Wildland Fire Hazard Conditions – Wind (p. 3.8-27)

Tier 1 WECS could be located within moderate, high, and very high Fire Hazard Severity Zones. Construction of Tier 1 WECS would be confined to existing structures, limited to 5 or 10 feet in height depending on underlying land use designation and would not contain any construction or operational components that could reasonably be expected to increase wildfire risk. As a result, impacts would be less than significant (Class III).

# Increase Fire Hazard Risk or Expose People or Structures to High Wildland Fire Hazard Conditions – Policy Changes (p. 3.8-27)

Adherence to existing policies and other policy changes proposed under the RESP would ensure streamlined solar and wind projects comply with San Luis Obispo County ordinances and applicable General Plan strategies, measures, and policies, including those in the COSE. This impact would be less than significant (Class III).

#### Findings:

The County finds, based on the Draft EIR, the Final EIR, and the whole of the record, that the proposed Program will result in less than significant impacts associated with creating a hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials (construction, solar, wind, and policy changes); creating a

hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment (solar, wind, and policy changes); emitting hazardous emissions or handling hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school (solar, wind, and policy changes); being located on, or adjacent to, a site which is included on a list of hazardous material/waste sites compiled pursuant to Government Code Section 65962.5 (Cortese List) and resulting in an adverse public health condition (solar, wind, and policy changes); impairing implementation of or physically interfering with an adopted emergency response plan or evacuation plan (solar, wind, and policy changes); if within the Airport Review designation or near a private airstrip, resulting in a safety hazard for people residing or working in the project area (solar, wind, and policy changes); and increasing fire hazard risk or expose people or structures to high wildland fire hazard conditions (solar, wind, and policy changes).

#### 6.9 LAND USE AND PLANNING

## Be Potentially Inconsistent with Land Use Policy/Regulation Adopted to Avoid or Mitigate for Environmental Effects (pp. 3.9-17 through -21)

The proposed RESP process was specifically designed to work within the County's existing environmental regulatory process and allow qualified projects to identify and avoid potential environmental effects. New proposed permit requirements would address gaps in the existing standards, identifying a range of site-level criteria and project characteristics that require discretionary review. Proposed permit requirements in Chapter 22.32 would rely on new "tiers" of SEFs and WECS. These tiers correspond to proposed definitions in Article 8 distinguishing between different types of electric-generating plants. These proposed definitions correspond to permit requirements proposed for Chapter 22.32.

Revisions to Title 22 also ensure that emerging types of renewable energy technologies (such as biomass) are subject to a discretionary permit process when appropriate, based on project size or land use category, including energy storage and solar thermal facilities. As any discretionary permit is required to comply with CEQA, clarifying permit processes for these technologies ensures that any potential environmental effects not anticipated by Title 22 are addressed through a subsequent environmental review. Currently, Chapter 22.32 allows electric-generating plants less than 40,000 square feet with Zoning Clearance. Revisions to Title 22 ensure that solar thermal facilities always require a Conditional Use Permit, while describing where energy storage facilities are primary land use permits versus accessory uses permitted with other energy-generating facilities.

The RESP also removes limitations on renewable energy established by Article 9 of Title 22. Currently, Article 9 (Community Planning Standards) prohibits electricity generation in select planning areas, communities, or areas throughout the county. Areas such as the Los Ranchos/Edna Village Specific Plan area are precluded from any type of electricity generation, including renewable energy production. Based on the applicability of land use permits described in Section 22.06.020 of Title 22, limitations in Article 9 preclude uses that are otherwise allowable as identified in Title 22, Article 2. For instance, where Article 2 identifies electric-generating plants as an allowable use, electricity production is not allowable if Article 9 prohibits electricity production for that parcel or area. The RESP removes these prohibitions and inconsistencies. Removing Article 9 limitations on electricity production provides greater

coordination throughout Title 22, allowing projects to rely on the proposed permit requirements in Chapter 22.32. The new permit requirements for renewable energy facilities would require any proposed in these areas to either avoid or mitigate potential environmental effects, or undergo discretionary review. Thus, revisions to Article 9 remove barriers to renewable energy, while revisions to Chapter 22.32 seek to apply discretionary review wherever a project may pose environmental impacts.

Because the proposed RESP clarifies development processes, adopts performance standards for renewable energy facilities, and works within the existing regulatory framework, the Program encourages renewable energy in a manner that avoids environmental impacts, the proposed RESP will have a less than significant (Class III) impact on policies and regulations adopted to avoid or mitigate environmental effects.

### Renewable Energy Combining Designation

The project implements General Plan policy to prioritize renewable energy development where it is feasible and does not significantly harm sensitive environmental resources. As described in the EIR, the proposed Renewable Energy (RE) Combining Designation provides ministerial permit approval for projects that meet performance standards identified in proposed additions to Section 22.14.100. Incorporating performance standards into Title 22 provides coordination between the code and adopted policies for renewable energy.

The RE Combining Designation process establishes application requirement and project design and operational standards to ensure consistency with adopted County policies. For instance, as described in the EIR, projects to be located on Important Agricultural Soils in the RE Combining Designation must provide conservation easement(s) as defined in the designation to become eligible for ministerial decision. Proposed standards in the designation require projects to demonstrate compliance with existing County policies, including proposed performance standards for setbacks, vegetation clearing and restoration, and avoidance/protection of habitat and special-status species. Project applicants demonstrating consistency with proposed Section 22.14.100 and Chapter 22.32 can achieve ministerial permit approval. Site or project conditions that triager discretionary review are clearly identified in Section 22.14.100.

Proposed additions to Section 22.14.100 screen out projects from streamlining that pose potential environmental impacts and require those projects to follow a discretionary permitting process that may trigger additional environmental review. Projects ineligible for streamlining under Section 22.14.100 are subject to the countywide permit requirements for renewable energy proposed for Chapter 22.32.

The proposed project includes LUO amendments that codify and/or cite adopted Conservation and Open Space Element strategies relating to renewable energy. The project also includes minor revisions to the Land Use and Circulation Element (LUCE), including changes that provide greater consistency between the renewable energy priorities of the COSE and the LUCE.

The RE Combining Designation would designate and encourage development of renewable energy resources, meeting County objectives to develop local renewable energy resources. Additionally, proposed measures under Section 22.14.100 identify when technical studies are warranted and if discretionary review is needed, based on certain adopted County policies. For instance, any potential conflicts with the Agricultural Element's protection of Important Agricultural Soils are addressed through required studies and additional standards in Section 22.14.100. Such projects that may harm environmental issues protected by other County policies

are screened through the proposed study process or mitigated through proposed standards, protecting such resources as agricultural lands or special-status species.

Accordingly, the RE Combining Designation is consistent with and implements County policies for renewable energy while providing standards and studies to protect other environmental issues addressed in the County General Plan. Therefore, the Program will provide streamlining for projects that avoid or mitigate potential environmental impacts consistent with adopted policies and regulations. New regulations will also identify project criteria that require additional studies and discretionary review to address potential environmental effects. Because the proposed Program provides a process for projects to avoid or mitigate environmental effects, this land use impact is considered less than significant (Class III).

# Be Potentially Inconsistent with Adopted Agency Environmental Plans or Policies with Jurisdiction over the Proposed Project (p. 3.9-22)

While the proposed RESP identifies multiples categories of renewable energy facilities, projects only qualify for permit streamlining where sited and designed in a manner that reduces potential environmental impacts based on standards in the Program. The provisions included in the RESP ensure that ministerial permit review is provided only to those projects with no substantial conflicts with adopted environmental plans or policies. Countywide, ministerial permit approval is available only to accessory energy-generating facilities and Tier 1 WECS or SEF projects that would not require environmentally related permits from agencies other than the County. Within the RE Combining Designation, Tier 2 and Tier 3 SEFS up to 160 acres could qualify for streamlining only where they do not require environmentally related permits or demonstrate consistency with proposed standards or Section 22.14.100.

Further, the RESP also provides greater consistency with adopted policies of the San Luis Obispo County General Plan, providing clarity for projects to implement renewable energy while minimizing impacts to environmental resources consistent with County policies. Because of the RESP's alignment with adopted County policies, and because projects requiring additional environmentally related permits are no longer eligible for ministerial review, the RESP avoids potential inconsistencies with adopted County environmental plans or policies. This impact is considered less than significant (Class III).

### Be Potentially Incompatible with Surrounding Land Uses (pp. 3.9-22 through -23)

Existing development standards in Title 22 for renewable energy technology types are limited, largely deferring to the general site planning and project design standards in Chapter 22.10 for general setbacks and height limitations. The proposed RESP includes new standards for SEFs and WECS countywide in Chapter 22.32, with additional standards for Tier 2 and Tier 3 SEFs in the RE Combining Designation established in proposed Section 22.14.100. The proposed new standards are reflective of the unique characteristics of SEFs and WECs, providing additional setbacks, height limitations, and design criteria specific both to the proposed technology and to the underlying land use category.

The unique characteristics of SEFs and WECS may pose conflicts to an adjacent land use. For example, as described in the EIR, solar energy facilities and wind energy conversion systems may result in new sources of daytime glare and lighting impacts to adjacent receptors (see Section 3.1, Aesthetics and Visual Resources). Within the RE Combining Designation, Tier 2 and Tier 3 SEFs allowable with a ministerial permit may be up to 160 acres in size. Projects of this scale are likely to change the visual character of the area. Another example of potential impacts to surrounding uses includes creation of new sources of noise. While the construction of new SEFs and WECS

would result in noise caused by equipment, the ongoing operation of these projects involves the use of on-site power inverters and other switchgear infrastructure.

Both existing standards of the County Code and proposed standards included in the Program would reduce effects that include noise, new sources of daytime glare, and lighting and visual impacts to surrounding land uses. New standards for discretionary projects direct projects to minimize and avoid such impacts, as exemplified in a new standard for Tier 3 WECS that requires projects to "be located to minimize visual impacts to residences" (see 22.32.060.D.6). The existing County Noise Ordinance (Sections 22.10.120.B-D) also requires that such equipment be enclosed or sited at such a distance from noise-sensitive land uses as to ensure compliance with noise performance standards (see Draft EIR Section 3.10, Noise). Proposed standards for Chapter 22.32 also seek to avoid impacts to surrounding uses. For instance, Chapter 22.32 establishes greater setbacks for SEFs in rural land use categories, recognizing the greater potential size and impacts of SEFs in rural greas. These standards clarify minimum setback requirements and height standards, ensuring adequate buffers from existing uses. Whereas the current Title 22 provides varying standards that do not directly correspond to renewable energy technology types, the proposed RESP includes a clear process with a range of development standards that reflect both the scale of the proposed project and the underlying land use category. Therefore, as a result of standards and permit processes proposed, indirect land use incompatibility impacts resulting from the Program will be less than significant (Class III).

#### Findings:

The County finds, based on the Draft EIR, the Final EIR, and the whole of the record, that the proposed Program will result in less than significant impacts associated with potential inconsistency with land use policy/regulation adopted to avoid or mitigate for environmental effects; potential inconsistency with adopted agency environmental plans or policies with jurisdiction over the proposed project; and potential incompatibility with surrounding land uses.

#### 6.10 Noise

Expose People to Noise Levels That Exceed the County Noise Ordinance Thresholds or General Plan Noise Element – Solar (pp. 3.10-12 through -14)

### Short-Term Construction Noise

Construction noise levels would be similar for both solar and wind installations, as well as for the construction of inverters and transformers, additional electrical equipment, interconnection or generation tie (gen-tie) lines, telecommunications equipment, switchgear buildings or structures, and security fencing. Construction noise typically occurs intermittently and varies depending on the nature or phase of construction (e.g., demolition and land clearing, grading and excavation, photovoltaic (PV) system installation, or wind turbine erection). Construction noise in any one particular area would be temporary and short term but would generate noise that could reach high levels for brief periods.

The maximum intermittent noise levels associated with construction equipment typically range from approximately 75 to 87 dBA  $L_{max}$  at 50 feet, though pile driving, which is not often employed, exceeds the typical construction noise range, producing noise levels of approximately 95 dBA  $L_{max}$  at 50 feet. Potential noise impacts to sensitive receptors would vary depending on multiple factors, including the distance between construction activities and sensitive receptors. Nevertheless, such noise levels could exceed the maximum noise levels allowed under the San Luis Obispo County Noise Ordinance. However, noise sources associated

with construction are exempt from the requirements of the County Noise Ordinance, provided such activities take place after 7:00 a.m. and before 9:00 p.m. on weekdays, or after 8:00 a.m. and before 5:00 p.m. on Saturdays or Sundays per County Code Section 22.10.120.A.

Since the County Code exempts construction activities from County noise requirements during times when most construction activity occurs, and any construction occurring outside of these times would need to demonstrate compliance with County noise requirements, construction-generated noise impacts would be less than significant.

### Long-Term Operational Noise

Typical noise sources associated with solar facility operations and maintenance may include power inverters, tracking motors on individual panels, corona discharge noise from gen tie-lines, and maintenance vehicles and activities (such as panel cleaning and repairs). For Tier 1 through Tier 3 solar electric facility (SEF) projects, it is likely that up to three personnel would be required to service and maintain each facility.

Solar facilities in proximity to sensitive receptors would be required to reduce the noise levels emitted from all inverters and other on-site switchgear sources. This would most likely be achieved by enclosing inverters and other on-site switchgear sources and/or siting them at such a distance from noise-sensitive land uses as to ensure compliance with the established noise standards. Compliance with Noise Element Policy 3.3.5 would be ensured in the cases that sensitive receptors are present by a site-specific noise analysis since this is the only way to quantify noise levels and identify appropriate noise reduction measures if necessary. Noise Element Implementation Measure 4.6 states that if the County Planning Director determines that a noise-sensitive land use may be exposed to noise levels exceeding County standards, notwithstanding the noise contour information in the Noise Element, an acoustical analysis meeting established County requirements would be required.

For Tier 1 through Tier 3 SEF projects, panel washing requirements and frequency would depend on technologies and site conditions, but typically would occur two to four times a year. Such noise levels could exceed the maximum noise levels allowed under the San Luis Obispo County Noise Ordinance; however, noise generated from maintenance activity, scheduled to occur as infrequently as two to four times of year, would be similar to noise generated during construction activity due to the type of equipment involved and its temporary nature. For these reasons, this impact is considered to be less than significant (Class III).

Expose People to Noise Levels That Exceed the County Noise Ordinance Thresholds or General Plan Noise Element – Wind (pp. 3.10-14 through -15)

### Short-Term Construction Noise

As previously stated, construction noise levels would be similar for both solar and wind installations. While construction noise levels could exceed the maximum noise levels allowed under the San Luis Obispo County Noise Ordinance, noise sources associated with construction are exempt from the requirements of Section 22.10.120.A of the County Code. As such, construction-generated noise impacts would be less than significant.

### Long-Term Operational Noise

As discussed and analyzed in Section 3.10, Noise, of the Draft EIR, wind energy conversion systems (WECS) generate two primary types of noise: aerodynamic noise from the turbine blades

passing through the air and mechanical noise from the gears and other components of the generator. Along with the wind turbine noise, typical noise sources associated with wind facilities operations and maintenance include inverter and switchgear noise.

The RESP only streamlines Tier 1 WECS projects in areas of the county zoned Agriculture (AG), Rural Lands (RL), Residential, Rural (RR), Commercial, Service (CS), Industrial (IND), Open Space (OS), or Public Facilities (PF). Operational noise from small turbines mounted on the roof of a conforming use would not generate any operational noise beyond the maximum allowed at the property line of receiving sensitive land uses. All on-site inverter and switchgear infrastructure from streamlined Tier 1 wind energy projects would be required to be enclosed or sited to ensure compliance with County Noise Element Policy 3.3.5. Therefore, WECS facilities streamlined under the RESP would not expose people to noise levels that exceed the County Noise Ordinance thresholds or Noise Element. This impact is considered to be less than significant (Class III).

## Expose People to Noise Levels That Exceed the County Noise Ordinance Thresholds or General Plan Noise Element – Policy Changes (p. 3.10-15)

Implementation of the proposed policy changes to the General Plan would enable streamlined reviews and approvals of SEF and WECS facility projects to be achieved either through the building permit process, zoning clearance process, or site plan review process. Since most construction activities would be exempted from noise standards and solar and wind facilities in proximity to sensitive receptors would be required to reduce the noise levels as required by County Noise Element Policy 3.3.5, which states that noise from new stationary sources that will expose an existing noise-sensitive use to noise levels which exceed identified standards have to reduce noise levels to or below said standards, noise impacts would be less than significant (Class III).

## Generate Permanent Increases in the Ambient Noise Levels in the Project Vicinity – Solar (pp. 3.10-15 through -16)

County Noise Element Policy 3.3.5 states that noise from new stationary sources that will expose an existing noise-sensitive use to noise levels which exceed identified standards have to reduce noise levels to or below said standards. Therefore, solar facilities in proximity to sensitive receptors would be required to reduce the noise levels emitted from all inverters and other on-site switchgear sources. Additionally, compliance with Noise Element Policy 3.3.5 would be ensured in the cases that sensitive receptors are present by a site-specific noise analysis since this is the only way to quantify noise levels. Noise Element Implementation Measure 4.6 states that if the County Planning Director determines that a noise-sensitive land use may be exposed to noise levels that exceed County standards, notwithstanding the noise contour information in the Noise Element, an acoustical analysis meeting established County requirements would be required.

For Tier 1 through Tier 3 SEF projects, panel washing requirements and frequency would depend on technologies and site conditions, but typically would occur two to four times a year. Such noise levels could exceed the maximum noise levels allowed under the San Luis Obispo County Noise Ordinance; however, noise generated from maintenance activity, scheduled to occur as infrequently as two to four times of year, would be associated with noise generated during construction activity due to the type of equipment involved and its temporary nature. This impact is less than significant (Class III).

# Generate Permanent Increases in the Ambient Noise Levels in the Project Vicinity – Wind (pp. 3.10-16 through -17)

As previously discussed, WECS generate two primary types of noise: aerodynamic noise from the turbine blades passing through the air and mechanical noise from the gears and other components of the generator. Along with the wind turbine noise, typical noise sources associated with wind facilities operations and maintenance include inverter and switchgear noise.

The RESP only streamlines Tier 1 WECS projects in areas of the county zoned Agriculture (AG), Rural Lands (RL), Residential, Rural (RR), Commercial, Service (CS), Industrial (IND), Open Space (OS), or Public Facilities (PF). Operational noise from small turbines mounted on the roof of a conforming use would not generate any operational noise beyond the maximum allowed at the property line of receiving sensitive land uses. All on-site inverter and switchgear infrastructure from streamlined Tier 1 wind energy projects would be required to be enclosed or sited to ensure compliance with County Noise Element Policy 3.3.5. Therefore, WECS facilities streamlined under the RESP would not expose people to noise levels that exceed the County Noise Ordinance thresholds or Noise Element. This impact is considered to be less than significant (Class III).

# Generate Permanent Increases in the Ambient Noise Levels in the Project Vicinity – Policy Changes (p. 3.10-17)

All SEC and WECS facilities are required to comply with County Noise Element Policy 3.3.5, which states that noise from new stationary sources that will expose an existing noise-sensitive use to noise levels which exceed identified standards have to reduce noise levels to or below said standards, noise impacts would be less than significant (Class III).

#### Cause a Substantial Temporary Increase in Noise Levels – Solar (p. 3.10-18)

Noise sources associated with construction are exempt from the requirements of the County Noise Ordinance, provided such activities take place after 7:00 a.m. and before 9:00 p.m. on weekdays or after 8:00 a.m. and before 5:00 p.m. on Saturdays or Sundays per County Code Section 22.10.120.A. It is expected that construction activity would occur within these times. Any construction associated with future renewable energy facilities that would occur outside of these times would not be exempt from the requirements of the County Noise Ordinance and would therefore be required to demonstrate compliance. Compliance with the Noise Ordinance would be ensured by a site-specific noise analysis since this is the only way to quantify noise levels and identify any necessary noise reduction mitigation. Since the County Code exempts construction activities from County noise requirements during times when most construction activity occurs, and any construction occurring outside of these times would need to demonstrate compliance with County noise requirements, construction-generated noise impacts would be less than significant (Class III).

### Cause a Substantial Temporary Increase in Noise Levels – Wind (pp. 3.10-18 through -19)

Based on the types of construction activities associated with Tier 1 WECS projects, peak noise levels are expected to be approximately 76 dBA  $L_{\rm eq}$  at 50 feet. Such noise levels could exceed the maximum noise levels allowed under the San Luis Obispo County Noise Ordinance. However, noise sources associated with construction are exempt from the requirements of the County Noise Ordinance, provided such activities take place after 7:00 a.m. and before 9:00 p.m. on weekdays, or after 8:00 a.m. and before 5:00 p.m. on Saturdays or Sundays per County Code Section 22.10.120.A. It is expected that the majority of future construction activity would occur

within these times. Any construction associated with future renewable energy facilities that would occur outside of these times would not be exempt from the requirements of the County Noise Ordinance and would therefore be required to demonstrate compliance.

For Tier 2 and above projects, compliance with the Noise Ordinance would be ensured by a site-specific noise analysis since this is the only way to quantify noise levels and identify any necessary noise reduction mitigation. Since the County Code exempts construction activities from County noise requirements during times when most construction activity occurs, and any construction occurring outside of these times would need to demonstrate compliance with County noise requirements, construction-generated noise impacts would be less than significant (Class III).

### Cause a Substantial Temporary Increase in Noise Levels – Policy Changes (p. 3.10-19)

As discussed above for solar and wind facilities, noise sources associated with construction are exempt from the requirements of the County Noise Ordinance, provided such activities take place after 7:00 a.m. and before 9:00 p.m. on weekdays or after 8:00 a.m. and before 5:00 p.m. on Saturdays or Sundays per Section 22.10.120.A of the County Code. The proposed Program does not make any changes to the County Noise Ordinance.

## Exposure of Persons to or Generation of Excessive Groundborne Vibration or Groundborne Noise Levels – Solar (p. 3.10-20)

Existing County Code Section 22.10.170.A states that any land use conducted in or within one-half mile of an urban or village reserve line needs to be operated so as to not produce detrimental earthborne vibrations perceptible at or beyond the boundary of the industrial land use producing the vibration source. Exceptions to this standard include vibrations from construction and the demolition of structures, between 7:00 a.m. and 9:00 p.m., and vibrations from moving sources such as trucks and railroads. Any construction associated with future renewable energy facilities that would occur outside of these times would not be exempt from the requirements of Section 22.10.170.A and would therefore be required to demonstrate compliance.

Compliance with the Section 22.10.170.A would be ensured by a site-specific noise analysis since this is the only way to quantify groundborne vibration levels and identify any necessary noise reduction mitigation. Since the County Code exempts construction activities from Section 22.10.170.A during times when most construction activity occurs, and any construction occurring outside of these times would need to demonstrate compliance with County requirements, potential groundborne vibration impacts would be less than significant (Class III).

# Exposure of Persons to or Generation of Excessive Groundborne Vibration or Groundborne Noise Levels – Wind (pp. 3.10-20 through -21)

Existing County Code Section 22.10.170.A states that any land use conducted in or within one-half mile of an urban or village reserve line needs to be operated so as to not produce detrimental earthborne vibrations perceptible at or beyond the boundary of the industrial land use producing the vibration source. Exceptions to this standard include vibrations from construction and the demolition of structures, between 7:00 a.m. and 9:00 p.m., and vibrations from moving sources such as trucks and railroads. Any construction associated with future renewable energy facilities that would occur outside of these times would not be exempt from the requirements of Section 22.10.170.A and would therefore be required to demonstrate compliance.

Compliance with Section 22.10.170.A would be ensured by a site-specific noise analysis since this is the only way to quantify groundborne vibration levels and identify any necessary noise reduction mitigation. Since the County Code exempts construction activities from Section 22.10.170.A during times when most construction activity occurs, and any construction occurring outside of these times would need to demonstrate compliance with County requirements, potential groundborne vibration impacts would be less than significant (Class III).

# Exposure of Persons to or Generation of Excessive Groundborne Vibration or Groundborne Noise Levels – Policy Changes (p. 3.10-21)

For solar and wind facilities, noise sources associated with construction are exempt from the requirements of the County Noise Ordinance, provided such activities take place after 7:00 a.m. and before 9:00 p.m. per existing Section 22.10.170.A of the County Code. It is expected that construction activity would occur within these times. Any construction associated with future renewable energy facilities that would occur outside of these times would not be exempt from the requirements of Section 22.10.170.A and would therefore be required to demonstrate compliance. Compliance with Section 22.10.170.A would be ensured by a site-specific noise analysis since this is the only way to quantify groundborne vibration levels and identify any necessary noise reduction mitigation.

Since the County Code exempts construction activities from Section 22.10.170.A during times when most construction activity occurs, and any construction occurring outside of these times would need to demonstrate compliance with County requirements, potential groundborne vibration impacts would be less than significant (Class III).

## If Located Within the Airport Review Designation or Adjacent to a Private Airstrip, Expose People Residing or Working in the Project Area to Severe Noise Levels – Solar (p. 3.10-21)

No projects identified in the RESP involve airport improvements, and none of the projects would result in the development or relocation of sensitive land uses that would result in increased exposure to aircraft noise levels. In addition, the project does not propose any changes in air traffic patterns. In terms of workers, it is likely that up to three personnel would be required to service and maintain each facility for Tier 1 through Tier 3 SEF projects. Activities such as panel washing requirements and frequency would depend on technologies and site conditions, but typically would occur two to four times a year. Due to the infrequency of worker activity, workers would not be exposed to severe noise levels from aircraft. For these reasons, less than significant (Class III) impacts due to aircraft operations and related noise levels would occur.

# If Located Within the Airport Review Designation or Adjacent to a Private Airstrip, Expose People Residing or Working in the Project Area to Severe Noise Levels – Wind (p. 3.10-22)

No projects identified in the RESP involve airport improvements, and none of the projects would result in the development or relocation of sensitive land uses that would result in increased exposure to aircraft noise levels. In addition, the project does not propose any changes in air traffic patterns. For these reasons, less than significant (Class III) impacts due to aircraft operations and related noise levels would occur.

# If Located Within the Airport Review Designation or Adjacent to a Private Airstrip, Expose People Residing or Working in the Project Area to Severe Noise Levels – Policy Changes (p. 3.10-22)

No projects identified in the RESP involve airport improvements, and none of the projects would result in the development or relocation of sensitive land uses that would result in increased

exposure to aircraft noise levels. In addition, the project does not propose any changes in air traffic patterns. For these reasons, less than significant (Class III) impacts due to aircraft operations and related noise levels would occur.

#### Findings:

The County finds, based on the Draft EIR, the Final EIR, and the whole of the record, that the proposed Program will result in less than significant impacts associated with exposing people to noise levels that exceed the County Noise Ordinance thresholds or General Plan Noise Element (solar, wind, and policy changes); generating permanent increases in the ambient noise levels in the project vicinity (solar, wind, and policy changes); causing a substantial temporary increase in noise levels (solar, wind, and policy changes); exposing people to or generating excessive groundborne vibration or groundborne noise levels (solar, wind, and policy changes); if located within the Airport Review designation or adjacent to a private airstrip, exposing people residing or working in the project area to severe noise levels (solar, wind, and policy changes).

#### 6.11 WATER RESOURCES

Violate Any Water Quality Standards – Solar (pp. 3.11-24 through -27)

#### Short-Term Construction

Compliance with the requirements of the State Water Resources Control Board (SWRCB) statewide general permits for construction and dewatering as well as the County Conservation and Open Space Element (Policy 4.2) and existing County Code (Section 22.52.120) would ensure that water quality degradation during the construction phase of projects proposed under the Program would be less than significant.

#### Long-Term Operations

Conformance with the existing County Code (Section 22.52.110) as well as with the requirements of state and federal water quality regulations, which would apply to all SEFs, and also the County (Conservation and Open Space Element Policy 4.2), would reduce the risk of violation of water quality standards to less than significant (Class III).

Violate Any Water Quality Standards – Wind (p. 3.11-27)

### Short-Term Construction

Tier 1 WECS, which would be mounted on a rooftop or existing structure, would be streamlined under the Program. Since Tier 1 WECS would be roof-mounted, no soil disturbance or excavation would occur, and the WECS would be mounted on structures sited in primarily urban areas, away from natural streams and wetlands. While Tier 2 WECS could be ground-mounted, the same state and County requirements would apply as described for the construction of SEF projects. Compliance with these requirements would ensure that water quality degradation during the construction phase of WECS projects would be less than significant.

### **Long-Term Operations**

Existing County Code Title 22, Section 22.52.110 requires a drainage plan for any project that increases or decreases runoff, any project that involves land disturbance of more than 20,000

square feet, or any project that results in impervious surface of more than 20,000 square feet. Therefore, such a drainage plan would be required of some Tier 2 WECS. The drainage plans will have to ensure that an on-site drainage system is in place which prevents increases or decreases in peak storm runoff levels. The drainage plans would also address stormwater discharge quality issues with site-specific stormwater protection mechanisms.

Conformance with the County Code as well as with the requirements of state and federal water quality regulations, which would apply to all Tier 2 WECS (Tier 1 WECS would be mounted on a rooftop or existing structure and therefore streamlined under the Program), would reduce the risk of violation of water quality standards to less than significant (Class III).

### Violate Any Water Quality Standards – Policy Changes (p. 3.11-27)

Conformance with the County Code as well as with the requirements of state and federal water quality regulations, which would apply to all Tier 2 and higher projects, would reduce the risk of violation of water quality standards to less than significant (Class III).

Substantially Deplete Groundwater Supplies or Interfere Substantially with Groundwater Recharge Such That There Would Be a Net Deficit in Aquifer Volume or a Lowering of the Groundwater Table Level – Solar (p. 3.11-28)

As stated in Section 2.0, Project Description, of the Draft EIR, the county covers 3,616 square miles, which is the equivalent of 2,314,240 acres. Therefore, the total reasonably foreseeable land footprint of the development under the proposed Program (1,500 acres) would constitute 0.06 percent of the county. As the majority of this land would remain in a permeable state, this would constitute a less than significant (Class III) impact to groundwater recharge.

Substantially Deplete Groundwater Supplies or Interfere Substantially with Groundwater Recharge Such That There Would Be a Net Deficit in Aquifer Volume or a Lowering of the Groundwater Table Level – Wind (p. 3.11-28)

It is assumed that the majority of renewable energy facilities allowed under the proposed Program would be solar projects, with minor numbers of wind projects. Furthermore, Tier 1 WECS projects would be mounted on an existing rooftop or existing structure and therefore would not contribute to increases in impervious surfaces. Resulting impacts would be less than significant (Class III).

Substantially Deplete Groundwater Supplies or Interfere Substantially with Groundwater Recharge Such That There Would Be a Net Deficit in Aquifer Volume or a Lowering of the Groundwater Table Level – Policy Changes (p. 3.11-28)

The implementation of the proposed policy changes would enable streamlined reviews and approvals of qualifying SEF and WECS projects to be achieved either through the building permit process, zoning clearance process, or site plan review process. The development of SEFs and WECS would be a less than significant (Class III) impact to groundwater recharge since the potential increase in impermeable surfaces is insignificant.

Substantially Alter the Existing Drainage Pattern of the Site or Area, Including Through the Alteration of the Course of a Stream or River, in a Manner Which Would Result in Substantial Erosion or Siltation On- or Off-Site – Solar (pp. 3.11-28 through -29)

The construction of SEF projects would be required to comply with state and County requirements. These requirements will, at a minimum, include the preparation and implementation of a stormwater pollution prevention plan (SWPPP) identifying specific best management practices to be implemented and maintained on the site in order to comply with the applicable narrative effluent standards as described more fully in Section 3.11, Water Resources, of the Draft EIR.

Runoff from operating solar energy generation facilities could include sediment. Implementation of sediment control BMPs and wind erosion control BMPs would ensure that erosion and siltation during the construction phase of SEF projects would be less than significant.

Existing County Code Title 22, Section 22.52.110 requires a drainage plan for any grading project that increases or decreases runoff, any project that involves land disturbance of more than 20,000 square feet, or any project that results in impervious surface of more than 20,000 square feet. Therefore, such a drainage plan would be required of SEF projects that exceed any of these thresholds. The drainage plans will have to ensure that an on-site drainage system is in place which prevents increases of siltation discharge via stormwater with site-specific protection mechanisms.

As such, conformance with the requirements of state and County water quality regulations, which would apply to all SEFs, would result in erosion and siltation impacts that are less than significant (Class III).

Substantially Alter the Existing Drainage Pattern of the Site or Area, Including Through the Alteration of the Course of a Stream or River, in a Manner Which Would Result in Substantial Erosion or Siltation On- or Off-Site – Wind (p. 3.11-29)

Tier 1 WECS, which would be mounted on a rooftop or existing structure, would be streamlined under the Program. Since Tier 1 WECS would be roof-mounted, no soil disturbance or excavation would occur, and the WECS would be mounted on structures sited in primarily urban areas, away from natural streams and wetlands. While Tier 2 WECS could be ground-mounted, the same state and County requirements would apply as under existing conditions. Compliance with these requirements would ensure that erosion and water siltation during the construction phase of the WECS projects would be less than significant. Conformance with the requirements of state and County water quality regulations would result in impacts related to erosion and siltation that are less than significant (Class III).

Substantially Alter the Existing Drainage Pattern of the Site or Area, Including Through the Alteration of the Course of a Stream or River, in a Manner Which Would Result in Substantial Erosion or Siltation On- or Off-Site – Policy Changes (pp. 3.11-29 through -30)

Continued conformance with the County Code, as well as with the requirements of state water quality regulations, is expected with implementation of the Program. Policy changes proposed under the Program would result in erosion and siltation impacts that are less than significant (Class III).

Create or Contribute Runoff Water Which Would Exceed the Capacity of Existing or Planned Stormwater Drainage Systems or Provide Additional Sources of Polluted Runoff – Solar (p. 3.11-30)

As previously stated, the construction of SEF projects would be required to comply with state and County requirements. These requirements will, at a minimum, include the preparation and implementation of a SWPPP identifying specific best management practices to be implemented and maintained on the site during construction in order to comply with the applicable narrative effluent standards as described more fully under Threshold 1.

Concerning operations, existing County Code Title 22, Section 22.52.110 requires a drainage plan for any project that increases or decreases runoff, any project that involves land disturbance of more than 20,000 square feet, or any project that results in impervious surface of more than 20,000 square feet. Therefore, such a drainage plan would be required of any SEF projects that exceed this threshold. The drainage plans will have to ensure that an on-site drainage system is in place which prevents increases of siltation discharge via stormwater with site-specific protection mechanisms.

Conformance with the requirements of state and County water quality regulations, which would apply to all SEFs, would reduce the risk of violation of water quality standards to less than significant (Class III).

Create or Contribute Runoff Water Which Would Exceed the Capacity of Existing or Planned Stormwater Drainage Systems or Provide Additional Sources of Polluted Runoff – Wind (p. 3.11-30)

Tier 1 WECS, which are the only wind energy projects streamlined under the Program, would not result in topographic modifications or the creation of new impervious surfaces because they would all be mounted on rooftops or existing structures. Also, Tier 1 WECS would not require water for construction or operation. Therefore, construction and operation of Tier 1 WECS would not create additional runoff and impacts would be less than significant (Class III).

Create or Contribute Runoff Water Which Would Exceed the Capacity of Existing or Planned Stormwater Drainage Systems or Provide Additional Sources of Polluted Runoff – Policy Changes (pp. 3.11-30 through -31)

Conformance with the County Code and with the requirements of state water quality regulations, which would apply to all Tier 2 and higher projects, would reduce runoff and stormwater drainage impacts to less than significant (Class III).

Substantially Alter the Existing Drainage Pattern of the Site or Area, Including Through the Alteration of the Course of a Stream or River, or Substantially Increase the Rate or Amount of Surface Runoff in a Manner Which Would Result in Flooding On- or Off-Site – Solar (p. 3.11-31)

Operation of SEFs could result in runoff that could result in flooding. The construction of larger SEF projects, or those involving grading, would be required to comply with County requirements relating to site disturbance (Existing County Code Title 22, Section 22.52.110). These requirements include the preparation of a drainage plan for any project that increases or decreases runoff, any project that involves land disturbance of more than 20,000 square feet, or any project that results in impervious surface of more than 20,000 square feet. Therefore, such a drainage plan would be required of most SEF projects. The drainage plans will have to ensure that an on-site drainage system is in place which adequately regulates stormwater. Per Conservation and Open Space Element Policy 6.4, drainage plans must also identify measures to detain or retain stormwater as appropriate in order to assist infiltration. Conformance with County water quality

regulations, which would apply to all SEFs exceeding these thresholds, would reduce the risk of violation of water quality standards to less than significant (Class III).

Substantially Alter the Existing Drainage Pattern of the Site or Area, Including Through the Alteration of the Course of a Stream or River, or Substantially Increase the Rate or Amount of Surface Runoff in a Manner Which Would Result in Flooding On- or Off-Site – Wind (p. 3.11-31)

Tier 1 WECS, which are the only wind energy projects streamlined under the Program, would not result in topographic modifications or the creation of new impervious surfaces because they would all be mounted on rooftops or existing structures. Therefore, operation of Tier 1 WECS would not create or contribute any substantial runoff water, and impacts would be less than significant (Class III).

Substantially Alter the Existing Drainage Pattern of the Site or Area, Including Through the Alteration of the Course of a Stream or River, or Substantially Increase the Rate or Amount of Surface Runoff in a Manner Which Would Result in Flooding On- or Off-Site – Policy Changes (p, 3.11-31)

Conformance with the existing County Code as well as with the requirements of state water quality regulations, which would apply to all Tier 2 and higher projects, would reduce runoff and flooding impacts to less than significant (Class III).

Place Within a 100-Year Flood Hazard Area Structures Which Would Impede or Redirect Flood Flows – Solar (pp. 3.11-31 through -32)

The County Safety Element regulates the potential to place structures within a 100-year Flood Hazard Area. Safety Element Standard S-16 states that to the extent practicable, development in areas of high flood hazard potential shall not be allowed, and Standard S-18 mandates the review of all plans for construction in low-lying areas or any area that may pose a serious drainage or flooding condition. Standard S-19 prohibits all development that would create or worsen known flood and drainage problems. Such a determination would most likely be made through the preparation of a drainage report (and remedial measures, as applicable), which would be required for all SEF projects exceeding certain thresholds or found to be potentially problematic areas, per existing County Code Title 22, Section 22.52.110. This impact is less than significant (Class III).

Place Within a 100-Year Flood Hazard Area Structures Which Would Impede or Redirect Flood Flows – Wind (p, 3.11-32)

Tier 1 WECS, which are the only wind energy projects streamlined under the Program, would not result in impacts to floodwaters because the projects would all be mounted on rooftops or existing structures and therefore would result in less than significant (Class III) impacts from floodwaters.

Place Within a 100-Year Flood Hazard Area Structures Which Would Impede or Redirect Flood Flows – Policy Changes (p. 3.11-32)

The implementation of the proposed policy changes would enable streamlined reviews and approvals of SEF and WECS facility projects to be achieved either through the building permit process, zoning clearance process, or site plan review process. Safety Element Standard S-16 states that to the extent practicable, development in areas of high flood hazard potential shall not be allowed, and Standard S-18 mandates the review of all plans for construction in low-lying

#### **FINDINGS OF FACT**

areas or any area that may pose a serious drainage or flooding condition. The proposed Program does not conflict with these policies as it does not direct or otherwise influence placement of renewable energy project in flood hazard areas. Impacts are less than significant (Class III).

Require or Result in the Need to Construct New Water Treatment Facilities or Expansion of Existing Facilities, the Construction of Which Could Cause Significant Environmental Issues – Solar (pp. 3.11-32 through -33)

As discussed and analyzed in Section 3.11, Water Resources, of the Draft EIR, a typical 20 megawatt (MW) facility would be expected to use approximately 215,000 gallons per year during operations. Furthermore, Conservation and Open Space Element Policy WR 1.8 restricts the use of water from surface water projects (e.g., Lopez Lake, Lake Nacimiento) to only serve development within urban and village reserve lines and not development in rural areas, where the majority of SEF projects would be constructed.

Approximately 60 percent of the county's water supply comes from groundwater sources. However, the Conservation and Open Space Element (Implementation Strategy WR 1.12.2) requires applications for land divisions which would increase density or intensity in groundwater basins with recommended or certified Levels of Severity II or III for water supply or water systems and are not in adjudication to include a water supply assessment (WSA) prepared by the applicable urban water supplier (as defined by California Water Code Section 10617). Additionally, as discussed in detail in the Draft EIR, Policies WR 1.13 and WR 1.14 protect groundwater supplies by preventing approval of General Plan amendments or land divisions that increase the density or intensity of nonagricultural uses in rural areas which have a recommended or certified Level of Severity II or III for water supply until a Level of Severity I or better is reached, unless there is an overriding public need

SEF projects would require the use of water during construction to reduce fugitive dust as well as during operations for panel washing purposes. These activities would not demand water to the extent that new water-producing and treating facilities would need to be constructed, potentially causing environmental impact, since they do not represent a substantial increase in water demand. Therefore, impacts related to the need to construct new water supply and treatment facilities which could then result in an environmental impact are less than significant (Class III).

Require or Result in the Need to Construct New Water Treatment Facilities or Expansion of Existing Facilities, the Construction of Which Could Cause Significant Environmental Issues – Wind (p. 3.11-33)

Operation of WECS would not impact the quantity or movement of available surface water or groundwater. Only Tier 1 WECS, which would be mounted on a rooftop or existing structure, would be streamlined under this Program. These projects would not use any water during operation since wind turbines do not require water for maintenance. Water spraying is typically used to reduce fugitive dust during construction. However, the construction of Tier 1 WECS would not require the use of water for this purpose since no ground disturbance is necessary. Impacts would be less than significant (Class III).

Require or Result in the Need to Construct New Water Treatment Facilities or Expansion of Existing Facilities, the Construction of Which Could Cause Significant Environmental Issues – Policy Changes (p. 3.11-34)

The implementation of the proposed policy changes to the General Plan would enable streamlined reviews and approvals of SEF and WECS facility projects to be achieved either through the building permit process, zoning clearance process, or site plan review process. No component of the Program, including policy changes, would result in the need to construct new water supply and treatment facilities which could then result in an environmental impact. Impacts are less than significant (Class III).

#### Findings:

The County finds, based on the Draft EIR, the Final EIR, and the whole of the record, that the proposed Program will result in less than significant impacts associated with violating water quality standards (solar, wind, and policy changes); substantially depleting groundwater supplies or interfere with groundwater recharge (solar, wind, and policy changes); substantially altering existing drainage pattern resulting in substantial erosion or siltation on- or off-site (solar, wind, and policy changes); creating or contributing runoff water exceeding the capacity of existing or planned stormwater drainage systems (solar, wind, and policy changes); substantially altering the existing drainage pattern of the site or area or substantial increase in the rate or amount of surface runoff resulting in flooding on- or off-site (solar, wind, and policy changes); placing structures within a 100-year flood hazard area structures which would impede or redirect flood flows (solar, wind, and policy changes); and requiring or resulting in the need to construct new water treatment facilities or expansion of existing facilities (solar, wind, and policy chanaes).

# 7.0 Less Than Significant Environmental Impacts with Incorporation of Mitigation Measures (Class II)

The category of Less Than Significant with Incorporation of Mitigation Measures (Class II) is not included in the EIR or these Findings of Fact, as any measures deemed necessary to reduce or avoid an identified impact are proposed to be codified (i.e., included in the County's implementing land use ordinances) as required performance criteria for projects proposed under the proposed Program. Any project that would require additional mitigation measures would not qualify for streamlining under the RESP pursuant to proposed section 22.32.020.2.9.b.

# 8.0 SIGNIFICANT, UNAVOIDABLE, AND ADVERSE ENVIRONMENTAL IMPACTS (CLASS I)

Based on the criteria set forth in the Draft EIR and the Final EIR, the County finds that the following environmental effects of the project are significant, unavoidable, and adverse. However, as explained in the Statement of Overriding Considerations contained in Section 12.0 below, these effects are considered to be acceptable when balanced against the economic, legal, social, technological, and other benefits of the project. Page numbers in parentheses refer to the Draft EIR unless otherwise noted.

#### 8.1 Aesthetics and Visual Resources

Have a Substantial Adverse Effect on a Scenic View – Solar and Policy Changes (pp. 3.1-15 through -16 and p. 3.1-17)

Implementation of the proposed Program could include enclosed and open areas containing installation infrastructure (e.g., solar panels, switchgear components, and on-site maintenance operation building/structure), access roads, and fencing. These built structures (e.g., buildings, piping, fencing, and collector arrays) would introduce industrial elements into the landscape that could contrast with surrounding undisturbed areas in form, line, color, and texture. Existing and proposed County Code requirements will minimize the visual impacts of solar installations; however, resulting site specific impacts to aesthetics are unknown.

#### Findings:

The County finds, based on the Draft EIR, the Final EIR, and the whole of the record, that the proposed Program will result in significant and unavoidable impacts to aesthetics and visual resources (substantial adverse effect on a scenic view – solar and policy changes) and that specific economic, legal, social, technological, or other considerations make infeasible the project alternatives identified in the Final EIR.

#### **Mitigation Measures**

The County enjoys a range of topography, elevation changes, and vistas. The screening required by proposed section 22.14.100.F.10 will be limited to the proposed site of the project. It is possible that roof and ground mounted SEF and WECS projects will be visible from vantage points away from the project at different elevations. Because the nature of the SEF and WECS projects is such that they must be open to the elements in order function properly, the same screening that would limit views of the equipment could also interfere with operation of the equipment by casting shadows or blocking wind. Further, in some vistas such as plateau or rolling plains, the addition of vegetation or screening might result in more an impact to the vista than the equipment alone. Other than screening of the sites which is already required by proposed section 22.14.100.F.10, there is no other feasible mitigation that would reduce or eliminate this impact. Further, no commenter provided recommendations or suggested mitigation that would reduce or eliminate the potential for impacts to visual resources.

### **Residual Impact**

To reduce associated visual impacts, all ground-mounted SEFs would be subject to Site Plan Review and performance standards such as height limitations and minimum setbacks of solar facilities from adjacent parcels. Additionally, ground-mounted SEFs would not be allowed on significant ridgetops or in areas containing scenic geologic resources, such as exposed bedrock or rock outcroppings. Setback standards would minimize visual intrusion to foreground views, the distances in which streamlined solar facilities would have the greatest daytime visibility. Similarly, height standards would also reduce visual impacts by helping to minimize vertical massing and line-of-sight intrusions from adjacent viewsheds. While these existing and proposed County Code requirements will minimize the visual impacts of solar installations, the site-specific setting and visual characteristics of all future SEFs proposed under the streamlining program cannot be known. Therefore, potential remains that certain SEFs could result in an aesthetic incompatibility within public view that would be considered significant, unavoidable, and adverse.

**Substantially Degrade the Visual Character of an Area – Solar and Policy Changes** (p. 3.1-18 and p. 3.1-19)

Development of SEFs associated with the implementation of the proposed Program could substantially degrade the visual character of an area. Existing and proposed County Code requirements will minimize the visual impacts of solar installations; however, resulting site specific impacts to aesthetics are unknown.

#### Findings:

The County finds, based on the Draft EIR, the Final EIR, and the whole of the record, that the proposed Program will result in significant and unavoidable impacts to aesthetics and visual resources (substantially degrade the visual character of an area – solar and policy changes) and that specific economic, legal, social, technological, or other considerations make infeasible the project alternatives identified in the Final FIR.

#### **Mitigation Measures**

The County enjoys a range of topography, elevation changes, and vistas. The screening required by proposed section 22.14.100.F.10 will be limited to the proposed site of the project. It is possible that roof and ground mounted SEF and WECS projects will be visible from vantage points away from the project at different elevations. Because the nature of the SEF and WECS projects is such that they must be open to the elements in order function properly, the same screening that would limit views of the equipment could also interfere with operation of the equipment by casting shadows or blocking wind. Further, in some vistas such as plateau or rolling plains, the addition of vegetation or screening might result in more an impact to the vista than the equipment alone. Other than screening of the sites which is already required by proposed section 22.14.100.F.10, there is no other feasible mitigation that would reduce or eliminate this impact. Further, no commenter provided recommendations or suggested mitigation that would reduce or eliminate the potential for impacts to visual resources.

#### **Residual Impact**

Ground-mounted SEF projects have the greatest potential to change the visual character of an area, especially the larger Tier 2 and Tier 3 SEFs. As described previously, all ground-mounted SEFs would be subject to a Site Plan Review and existing and proposed County Code requirements to minimize the visual impacts to the greatest extent possible. While these existing and proposed County Code requirements will minimize the visual impacts of solar installations, the site-specific setting and visual characteristics of all future SEFs proposed under the Program cannot be known. Therefore, implementation of the Program could indirectly result in the development of solar energy projects that substantially degrade the visual character of an area. Potential for this impact is considered significant, unavoidable, and adverse (Class I).

# 8.2 AGRICULTURAL RESOURCES

**Convert Important Agricultural Soils to Nonagricultural Use – Solar and Policy Changes** (pp. 3.2-48 through -49 and p. 3.2-50)

The proposed Program and changes to County policies could result in the conversion of Important Agricultural Soils to nonagricultural uses.

#### Findings:

The County finds, based on the Draft EIR, the Final EIR, and the whole of the record, that the proposed Program will result in significant and unavoidable impacts to agricultural resources (convert important agricultural soils to nonagricultural use – solar and policy changes) and that specific economic, legal, social, technological, or other considerations make infeasible the project alternatives identified in the Final EIR.

## **Mitigation Measures**

Proposed section 22.14.100.F.9 requires agricultural easements for all projects except Tier 1 ground mounted SEF 20 acres or less in size. Proposed section 22.14.100.F.4 requires that Tier 1 projects be located on "...disturbed areas with site disturbance such as grading, paving, development, or other improvements..." As noted in the EIR, disturbed areas can also be important Agricultural Soils.

While a conservation easement measure could be similarly applied to Tier 1 ground-mounted SEFs proposed on Important Agricultural Soils, this requirement would run counter to the primary objectives of the Program of removing barriers to approval. Requiring conservation easements for SEFs that are 20 acres or less in size would place additional financial and legal burden on small agricultural landowners, essentially discouraging applications and defeating the streamlining efforts. No commenter provided recommendations or suggested mitigation that would reduce or eliminate the potential for impacts to Important Agricultural Soil resources from Tier 1 ground mounted SEF projects.

# **Residual Impact**

Ground-mounted Tier 1 SEFs up to 20 acres in total footprint size would be eligible for streamlining throughout the county (excluding the Coastal Zone) as long as they are located on disturbed land. This does not preclude the potential for ground-mounted Tier 1 SEFs up to 20 acres in size being developed on Important Agricultural Soils, as disturbed soils can also be Important Agricultural Soils.

In contrast, Tier 2 and 3 SEFs proposed for streamlining eligibility cannot be located on Important Agricultural Soils, unless sited on soils solely designated as Highly Productive Rangeland soils. Under the County Code, SEFs subject to a discretionary permit that are proposed on Important Agricultural Soils are required to provide a conservation easement at a 3:1 ratio on a parcel in the county other than the proposed project site. As the conservation measure is considered infeasible for Tier 1 ground mounted SEF projects, this impact is considered significant, unavoidable, and adverse.

#### 8.3 LAND USE AND PLANNING

Preclude an Existing or Permitted Land Use, or Create a Disturbance That Would Diminish the Function of a Particular Land Use (p. 3.9-24)

The proposed Program could indirectly create a disturbance that would diminish the function of a particular land use.

Findings:

The County finds, based on the Draft EIR, the Final EIR, and the whole of the record, that the proposed Program will result in significant and unavoidable impacts to land use and planning (preclude an existing or permitted land use, or create a disturbance that would diminish the function of a particular land use) and that specific economic, legal, social, technological, or other considerations make infeasible the project alternatives identified in the Final EIR.

#### **Mitigation Measures**

Proposed section 22.14.100.F.9 requires agricultural easements for all projects except Tier 1 ground mounted SEF 20 acres or less in size. Proposed section 22.14.100.F.4 requires that Tier 1 projects be located on "...disturbed areas with site disturbance such as grading, paving, development, or other improvements..." As noted in the EIR, disturbed areas can also be important Agricultural Soils.

While a conservation easement measure could be similarly applied to Tier 1 ground-mounted SEFs proposed on Important Agricultural Soils, this requirement would run counter to the primary objectives of the Program of removing barriers to approval. Requiring conservation easements for SEFs that are 20 acres or less in size would place additional financial and legal burden on small agricultural landowners, essentially discouraging applications and defeating the streamlining efforts.

Even with the agricultural easement requirement, projects developed under the program would still result in the conversion of existing agricultural land into non-agricultural uses. The agricultural easement does not necessarily result in the addition of new agricultural land to replace the land used for the SEF or WECS project. While SEF and WECS projects are expected to develop a decommission plan pursuant to proposed section 22.32.040, during operation of the facilities, and before the decommissioning plan is implemented, the lands will not be available for agricultural use.

No commenter provided recommendations or suggested mitigation that would reduce or eliminate the potential for impacts to Important Agricultural Soil resources from Tier 1 ground mounted SEF projects.

#### **Residual Impact**

As discussed in the EIR, the proposed Program is consistent with the County's overall goals, objectives, plans, and policies, as established in the General Plan and codified in the Land Use Ordinance. The one exception identified is the potential for the Program to indirectly result in the conversion of agricultural land uses to renewable energy uses, as discussed above. Accordingly, this impact is similarly identified as significant, unavoidable, and adverse.

#### 9.0 FEASIBILITY OF PROJECT ALTERNATIVES

An EIR must briefly describe the rationale for selection and rejection of alternatives. The lead agency may make an initial determination as to which alternatives are feasible, and therefore merit in-depth consideration, and which are infeasible. The alternatives analyzed in the Draft EIR were ultimately chosen based on each alternative's ability to feasibly attain the basic program objectives while avoiding or reducing one or more the program's significant effects. The EIR discussed several alternatives to the proposed project in order to present a reasonable range of alternatives. The alternatives evaluated included:

Alternative 1 – Limited Combining Designation Scope

Alternative 2 – Smaller Combining Designation Footprint

Alternative 3 – No Project

# 9.1 ALTERNATIVE 1 – LIMITED COMBINING DESIGNATION SCOPE

Alternative 1 consists of an RE Combining Designation that is more limited in scope than that of the proposed RESP by limiting projects to rooftop and structure-mounted projects, and ground-mounted projects of 40 acres or less. The intent of this alternative is to reduce the project's Class I impacts to aesthetics and visual resources (by requiring screening from public view), agricultural resources (by requiring that Tier 1 ground-mounted SEFs not be located on Important Agricultural Soils), and land use and planning, and reduce overall impacts to other resource areas by substantially reducing the maximum allowed project footprint.

#### **Aesthetics and Visual Resources**

This alternative is intended to eliminate the Class I impacts associated with the views of larger (160-acre) SEF projects and WECS projects with 100-foot ground-mounted wind turbines. As noted in the EIR, projects of this size can be screened from view along the adjacent roadway, but fully screening them from public view may not always be technically feasible. By reducing the potential size of the project from 160 acres to 40 acres, the potential for aesthetic impact is less than with the proposed Program. Even with this reduction in size, however, projects may still be visible from off-site public views and would remain a Class I impact.

#### **Agricultural Resources**

Because this alternative would not allow ministerial approvals for ground-mounted Tier 1 SEF projects located on Important Agricultural Soils, the potential impact on agricultural resources would be less than that of the proposed Program and would reduce the Class I impact to Class III.

#### Air Quality

This alternative would result in smaller individual projects but may result in the same amount of land being disturbed as the proposed RESP, as there is no prohibition on the number of projects, only the size. It is also possible that smaller project sizes would result in more overall land being disturbed because more area for access roads and utility equipment would be needed to serve more individual projects. Overall, construction and operational air quality impacts would be similar to those of the proposed Program (Class III).

#### **Biological Resources**

An emphasis on roof-mounted and smaller ground-based SEF and WECS projects envisioned by this alternative would reduce the potential for biological impacts when compared to the proposed RESP. Provisions of the Program require a biological analysis for ground-mounted projects, and similar provisions would be required for any project under this alternative. As a result, impacts to biological resources would be considered Class III, similar to the proposed Program.

#### **Cultural Resources**

Limiting project sites to building sites and making the overall sites smaller than those envisioned by the proposed Program could reduce the potential for cultural resource impacts. However, as there is no cap on the number of projects, it is possible that the same land area would be developed, only in smaller pieces. Adherence to state law as well as to the provisions of the Program would result in Class III impacts, similar to those of the proposed RESP.

#### **Geology and Soils**

An emphasis on roof-mounted and smaller ground-based SEF and WECS projects envisioned by this alternative could reduce the potential for soil disturbance and associated impacts when compared to the proposed Program. Multiple smaller projects directed away from Important Agricultural Soils may still disturb the same amount of land as the proposed RESP.

Provisions of the Program require a detailed grading plan (Section 22.08.030) as part of the application and site review process. Because any project meeting the criteria for a grading plan would have a similar review and approval process with the County, the impacts of this alternative would be similar to those of the proposed Program. As a result, impacts to geology and soils would be considered Class III, similar to the proposed RESP.

### **Greenhouse Gases and Climate Change**

While smaller individual projects would result in less grading and construction per project, there is no cap on the number of renewable energy projects. Therefore, this alternative may result in a similar amount of area being developed. Further, it is possible that multiple smaller projects may result in more land being developed, as there would be more area needed for access and equipment than if there were fewer but larger projects. Overall, this alternative would result in similar Class III and IV impacts with respect to greenhouse gases and climate change.

#### Hazards and Hazardous Materials

This alternative could result in smaller individual projects than the proposed Program. Smaller projects are likely to have a smaller quantity of potentially hazardous materials in a single location, which reduces the magnitude of impact from an accidental spill or misuse. However the larger number of projects would increase the number of areas that store material and therefore also increase the potential for spill or misuse. The County regulates the storage and use of potentially hazardous materials through existing ordinances and provisions of the Program, and these regulations would also apply to any project under this alternative. The impacts of project development on hazards and hazardous materials are considered Class III, similar to those of the proposed RESP.

# **Land Use and Planning**

This alternative would still permit Tier 1 and smaller Tier 2 projects on land in the county. Impacts associated with land use are considered mostly similar to those of the proposed Program. However, this alternative would not allow ministerial approvals for ground-mounted Tier 1 SEFs located on Important Agricultural Soils, thereby reducing impacts related to agricultural land to less than significant (Class III).

#### **Noise**

Transformers associated with SEF projects are known to make noise, and both setbacks and screening included in the RESP address this issue. Because this alternative could result in a greater number of smaller projects, there could accordingly be more transformers. However the smaller projects would result in smaller transformers and less noise. Regardless, because setback and screening requirements would still apply, impacts would remain similar to the proposed project. The Program addresses these issues and would apply to any project in this alterative, resulting in a Class III impact.

#### **Water Resources**

While the project size would be smaller, the number of projects would increase. Water usage is incidental to the project overall and is needed to wash the solar panels. Therefore, whether there are panels in a single location or in several locations, the amount of water usage is likely to stay the same. There would still be the need for dust control during construction and washing of the SEF installations to ensure performance. Similar to the proposed Program, this alternative would represent a Class III impact.

#### Findings:

Alternative 1, the No Project alternative, would result in lesser impacts. This alternative would meet objectives 1 and 4 by providing a clear statement as to where facilities could be located and establishing precise standards for construction in the RESP. Objectives 2 and 3 would not be fully realized, as the alternative places greater restrictions on project size and siting. This would not further the intent of encouraging renewable energy generation in more areas of the county. Overall, this alternative would reduce Class I agricultural resources and related land use and planning impacts to Class III, while aesthetics and visual resources impacts would remain Class I, and other impact areas would have similar Class III impacts to those of the proposed Program.

### 9.2 ALTERNATIVE 2 – SMALLER COMBINING DESIGNATION FOOTPRINT

Alternative 2 consists of a RE Combining Designation that excludes all land with Important Agricultural Soils. This would reduce the total acreage of the RE Combining Designation from 801,910 acres to approximately 483,570 acres, a reduction of approximately 40 percent. The sole intent of this alternative is to reduce the potential for Class I impacts associated with the conversion of agricultural land to nonagricultural uses, identified in Sections 3.2, Agricultural Resources, and 3.9, Land Use and Planning, of the Draft EIR. All other aspects of the Program as proposed would remain unchanged.

#### **Aesthetics and Visual Resources**

This alternative would avoid conversion of Important Agricultural Soils but still result in project sizes and features similar to those of the proposed Program. Screening for larger (160-acre) sites is effective only when the observer is relatively close to the project site. From a distance or with even a slight topographic elevation, SEF projects will be visible. The EIR determined that, even with the screening measures required by the Program, the visual impact of the proposed project is considered Class I with no certainty of effective and feasible mitigation for all future projects under the Program. This alternative would have a similar Class I impact.

#### **Agricultural Resources**

This alternative would not permit streamlining of SEF or WECS project on any land with Important Agricultural Soils. Because none of the identified significant agricultural soil categories would be affected, the alternative would reduce a Class I impact to a Class III impact.

#### **Air Quality**

This alternative assumes that Important Agricultural Soils would be avoided but that a similar amount of land area may be affected. Land disturbance would be similar to that of the proposed RESP. Overall, construction and operational air quality impacts would be similar to those of the proposed Program (Class III).

# **Biological Resources**

This alternative would have less land disturbance and therefore less of a potential to impact biological resources. Provisions of the Program require a biological analysis for ground-mounted projects, and similar provisions would be required for any project under this alternative. As a result, impacts to biological resources would be considered Class III, similar to the proposed RESP.

# **Cultural Resources**

The potential land area for development with this alternative is less than that of the proposed Program. With less land area potentially affected by construction, the impact to cultural resources would also be less than that of the proposed RESP. Construction requirements of the County and the Program would result in similar Class III impacts to cultural resources.

#### **Geology and Soils**

Provisions of the LUO require a detailed grading plan (Section 22.08.030) as part of the application and site review process. Because any project meeting the criteria of the LUO for a grading plan would have a similar review and approval process with the County, the impacts of this alternative would be similar to those of the Program (Class III).

#### **Greenhouse Gases and Climate Change**

The potential buildout scenario under this alternative would be similar to that of the proposed Program. Total land disturbed and construction and operational emissions would likewise be similar. Accordingly, this alternative would result in similar Class III and IV impacts with respect to greenhouse gases and climate change.

# **Hazards and Hazardous Materials**

The Program as proposed would result in potential for larger facilities to store hazardous materials such as herbicides and dust palliatives. This alternative assumes projects with storage needs similar to those of the proposed Program. The County regulates the storage and use of potentially hazardous materials through existing ordinances and provisions in the Program, and these regulations would also apply to any project under this alternative. The impacts of project development on hazards and hazardous materials are considered Class III, similar to those of the proposed Program.

#### **Land Use and Planning**

The emphasis on avoiding Important Agricultural Soils would result in a Class III land use and planning impact related to agricultural land conversion, compared to the Class I impact associated with the proposed Program. However, the elimination of these agricultural lands may result in some of these projects moving into other areas of the county and affecting different resources. Further, restricting the ability of existing farms to make use of SEF or WECS projects to offset operational costs may affect the viability of smaller farms, leading to a request for land conversion.

#### **Noise**

Transformers associated with SEF projects are known to make noise, and both setbacks and screening included in the proposed Program address this issue. Projects associated with this alternative will have transformers in need of setback and noise attenuation. Therefore, noise impacts would remain similar to the Program. The Program addresses noise by establishing design criteria that also apply to any future project that would be proposed in this alterative, resulting in a similar Class III impact.

#### **Water Resources**

This alternative assumes project sizes similar to those allowed in the proposed Program and needing the same amounts of water during construction and operation as the proposed Program. Therefore, this alternative would result in similar Class III impact to water resources.

#### Findings:

This alternative could result in similarly sized projects as the proposed Program but may result in smaller projects overall in order to avoid Important Agricultural Soils. The Class I agricultural resources and land use and planning impacts associated with the proposed Program would be reduced to Class III impacts under this alternative, while the Class I aesthetics and visual resources impacts would remain.

An indirect impact of this alternative may be a need to expand the combining designation in order to meet the projected need for renewable energy projects. The expansion may need to occur on slopes, ridgelines, and other areas that are not suited to agriculture.

Another indirect impact may be that farmers with lands meeting these criteria may be prevented from installing renewable energy systems on their lands simply because of the soils involved. This would be counter to the intent of the Program and could result in an undue burden on the agricultural use. This alternative would meet objectives 1, 2, and 4. Objective 3 would be met, albeit to a lesser extent than that of the proposed RESP, as it is likely that fewer projects would be developed due to the 40 percent reduction in the RE Combining Designation area.

# 9.3 ALTERNATIVE 3 – NO PROJECT

Alternative 3 is the CEQA-mandated No Project Alternative. Under Alternative 3, existing policies governing renewable energy development in the county would remain in place. Environmental impacts may be reduced in some instances because all projects would be evaluated individually and with potentially greater scrutiny. However, Alternative 3 could also result in more

cumbersome permitting processes with less certain outcomes, thus resulting in less renewable energy development than would occur under the proposed Program.

# **Aesthetics and Visual Resources**

Existing County policies allow the installation of roof-mounted solar panels with issuance of a building permit. There are no provisions for ground-mounted panels or installation of wind turbines; however, as long as the setback provisions of Title 22 are met, permits for these types of projects are also issued as a ministerial act.

The proposed Program establishes location and screening criteria that address visual impacts for all project sizes. The no project alternative would not result in a single set of standards and could therefore result in a variety of visual impacts.

Customized visual mitigation would likely be required as each project moved through the approval process, and in most cases would probably result in less than significant impacts with mitigation incorporated (Class II) if the project is visible from a public road. If not visible from a public road, projects would be Class III.

The current process, while taking longer than the proposed, may result in reduced impacts when compared to the proposed Program. Projects likely to have Class I impacts would be required to prepare an independent project-specific EIR, with mitigation measures and findings as appropriate. For smaller projects, the cost and time associated with preparation of an EIR may reduce the extent or prevent participation in the Program.

As proposed, Tier 2 and above projects outside of the combining district will require discretionary review and may result in site-specific mitigation in addition to the program requirements. Because each project would be required to mitigate impacts to an individual level, the potential for Class I impacts will be reduced when compared to the proposed Program.

#### **Agricultural Resources**

Currently each request for a renewable energy project is addressed individually. Elements of the proposed Program also require site information specific to the development request. The Class I impact identified for the proposed Program is related to SEFs of 20 acres or less that may be located on Important Agricultural Soils (albeit disturbed), without need for mitigation. Under the no project alternative, it is likely that this type of project would trigger discretionary review, CEQA analysis, and mitigation, thus resulting in a Class II impact.

#### **Air Quality**

Due to lack of a streamlining program, this alternative could result in fewer projects and less land area affected. Construction requirements of the County and conditions of approval from the discretionary project review required under this alternative would likely result in Class II or III impacts for this alternative. Note that the Class II determination would be a function of mitigation measures proposed for individual projects. The proposed Program includes these measures as permit requirements. Overall, impacts would be similar to those of the proposed Program.

# **Biological Resources**

Due to lack of a streamlining program, this alternative could result in fewer projects, less land area affected, and potentially lesser impacts to biological resources. All projects (save for roof-mounted SEFs) would require discretionary review and appropriate mitigation measures for impacts to biological resources. While such impacts would be considered less than significant with mitigation incorporated (Class II), this is equivalent to the Class III impacts identified for the proposed Program, since the biological resource protective measures and standards have been incorporated into the RESP.

#### **Cultural Resources**

The potential land area for development with this alternative is less than that of the proposed Program. However, the alternative could result in an equivalent overall land footprint and thus impacts to cultural resources would be similar to those of the proposed Program. Construction requirements of the County and CEQA would result in a determination of less than significant with mitigation incorporated (Class II), equivalent to the Class III impacts identified for the proposed Program, since the cultural resource protective measures and standards have been incorporated into the RESP.

# **Geology and Soils**

The County Code already requires grading plans for ground disturbance, which would address any impacts under this alternative. As a result, impacts to geology and soils would be considered less than significant with mitigation incorporated (Class II), which is equivalent to the Class III impacts identified for the proposed Program since the resource protective measures and standards have been incorporated into the RESP. The impacts of this alternative would be similar to those of the proposed Program.

#### **Greenhouse Gases and Climate Change**

Due to lack of a streamlining program, this alternative could result in fewer projects and less land area affected. Construction requirements of the County and conditions of approval from the discretionary project review required under this alternative would likely result in Class II or III impacts for this alternative. Note that the Class II determination would be a function of mitigation measures proposed for individual projects. The proposed Program includes these measures as permit requirements. Overall, impacts would be similar to those of the proposed RESP.

#### **Hazards and Hazardous Materials**

This alternative assumes projects with storage needs similar to those of the proposed Program. The County regulates the storage and use of potentially hazardous materials through existing ordinances, and these regulations would apply to any project under this alternative. As a result, impacts to would be considered less than significant with mitigation incorporated (Class II), which is equivalent to the Class III impacts identified for the proposed Program, since the resource protective measures and standards have been incorporated into the RESP. The impacts of this alternative would be similar to those of the proposed Program.

# **Land Use and Planning**

The no project alternative would allow each property owner to approach the County for renewable energy projects where allowable by the current LUO or where the proposed project is considered an accessory electric generating plant generating power for on-site use only. Overall, the impact on land use and planning would be less (Class III) for this alternative, as it is reasonably foreseeable that conversion of important agricultural land would be mitigated or avoided through the discretionary review and CEQA compliance processes.

#### **Noise**

Projects associated with this alternative will have transformers in need of setback and noise attenuation. Therefore, noise impacts would remain similar to the proposed Program. Compliance with the CEQA process for each project would address noise by establishing design criteria that apply to each project in this alterative, resulting in a determination of less than significant with mitigation incorporated (Class II), which is the same as the Class III anticipated by meeting the performance standards incorporated into the proposed Program.

#### **Water Resources**

This alternative assumes project types and sizes similar to the proposed Program and using the same amounts of water during construction and operation. Compliance with the CEQA process for each project would address water resources, likely resulting in a determination of a less than significant impact (Class III) or less than significant impact with mitigation incorporated (Class II). Overall, impacts would be similar to those of the proposed Program.

#### Findings:

This alternative would result in less impacts than associated with implementation of the proposed Program and a reduction in impacts associated with aesthetics and visual resources and agricultural resources. However, under this alternative, objectives 1 through 4 would not be met. Therefore, because this alternative does not meet the Program objectives, it is rejected as a viable option.

### **10.0** LONG-TERM IMPLICATIONS

#### 10.1 GROWTH INDUCEMENT POTENTIAL

CEQA Guidelines Section 15126.2(d) requires that an EIR evaluate the growth-inducing impacts of a proposed action. A growth-inducing impact is defined in CEQA Guidelines Section 15126.2(d) as follows:

...the way in which a proposed project could foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment. Included in this are projects which would remove obstacles to population growth...Increases in the population may tax existing community service facilities, requiring construction of new facilities that could cause significant environmental effects. Also...the characteristic of some projects which may encourage and facilitate other activities that could significantly affect the environment, either individually or cumulatively.

While implementation of the proposed Program would contribute to energy supply, which indirectly supports population growth, the proposed development of projects associated with the

#### **FINDINGS OF FACT**

Renewable Energy Streamlining Program (RESP; Program) is a response to the state's need for renewable energy to meet its Renewables Portfolio Standard. Unlike a gas-fired power plant, projects associated with this program EIR are not being developed as a source of baseload power in response to growth in demand for electricity. The power generated would be added to the state's electricity grid with the intent that it would displace fossil fuel-based power plants and their associated environmental impacts, consistent with the findings and declarations in Senate Bill 2 (2011) that a benefit of the Renewables Portfolio Standard is displacing fossil fuel consumption in the state. In addition, the RESP is also consistent with the County's EnergyWise Plan's renewable energy goals to increase the production of renewable energy from small- and commercial-scale energy installations.

Implementation of the RESP would supply energy to accommodate and support existing demand and projected growth, but it would not foster any new growth because (1) the additional energy would be used to ease the burdens of meeting existing statewide energy demands within and beyond the area of the project; (2) it would displace energy demand currently met by fossil fuels; and (3) the factors affecting growth are so diverse that any potential connection between additional energy production and growth would necessarily be too speculative and uncertain to merit further analysis.

Additionally, RESP implementation would not involve the development of any new roadways, water systems, or sewer; thus, the projects would not further facilitate additional development. Therefore, infrastructure improvements to serve each of the projects approved in association with the RESP are limited and would not be available to serve surrounding areas. In fact, Tier 1 solar electric facilities (SEF) and wind energy conversion systems (WECS) projects would be located on existing developed land uses zoned for development, and Tier 2 and Tier 3 SEF projects would be located in urban areas (vacant or non-vacant) on land uses designated as Commercial (CS) or Industrial (IND). While this document has considered that SEF and WECS projects might foster regional growth, the particular growth that could be attributed to these projects is unpredictable, given the multitude of variables at play, including uncertainty about the nature, extent, and location of growth and the effect of other contributors to growth besides the RESP. However, despite these uncertainties, the RESP is not considered to be growth-inducing since the overall goal of the program helps to achieve the County's renewable energy goals that implement statewide energy goals.

Findings:

The County finds, based on the Draft EIR, the Final EIR, and the whole of the record, that the proposed Program will result in less than cumulatively considerable impacts related to growth inducement.

#### 10.2 SIGNIFICANT IRREVERSIBLE ENVIRONMENTAL CHANGES

Public Resources Code Section 21100(b)(2), a part of CEQA, requires that certain EIRs include a discussion of significant irreversible environmental changes of project implementation. State CEQA Guidelines Section 15126.2(c) describes irreversible environmental changes as follows:

Uses of nonrenewable resources during the initial and continued phases of the project may be irreversible since a large commitment of such resources makes removal or non-use thereafter unlikely. Primary impacts and, particularly, secondary impacts (such as highway improvement which provides access to a previously inaccessible area) generally commit future generations to similar uses. Also irreversible damage can result from environmental accidents associated with the project. Irretrievable commitments of resources should be evaluated to assure that such current consumption is justified.

#### **Nonrenewable Resources**

Energy resources needed for the construction of projects associated with RESP implementation would contribute to the incremental depletion of nonrenewable resources. Nonrenewable resources such as steel, copper, lead and other metals, gravel, concrete, and other materials are typically considered finite and would not be replenished over the lifetime of each of the projects associated with implementation of the Program. Thus, implementation of the RESP would irretrievably commit resources over the anticipated life span of the projects associated with the program. However, during decommissioning, some of these resources (i.e., steel, concrete, etc.) can be recycled or reclaimed for other uses and as such, would be renewable to a certain degree.

Findings: The County finds, based on the Draft EIR, the Final EIR, and the whole of

the record, that the proposed Program will result in less than cumulatively considerable impacts related to irreversible environmental changes.

#### 10.3 ENERGY USE

In order to ensure that energy implications are considered in project decisions, CEQA requires that EIRs include a discussion of the potential energy impacts of proposed projects, with particular emphasis on avoiding or reducing inefficient, wasteful, and unnecessary consumption of energy (see Public Resources Code Section 21100(b)(3)). According to Appendix F of the State CEQA Guidelines, the goal of conserving energy implies the wise and efficient use of energy including:

- 1. Decreasing overall per capita energy consumption by creating afforded streamline permitting for renewable energy projects.
- 2. Decreasing reliance on natural gas and oil by increasing the production of renewable energy from small- and commercial-scale energy installations to account for 10 percent of total local energy by 2020.
- 3. Increasing reliance on renewable energy sources by providing a clear process and expectations for renewable energy projects in suitable locations that minimize environmental impacts.

Implementation of the RESP would help achieve these goals because it would develop a renewable source of power, helping to offset the use of nonrenewable resources and contribute to an overall reduction of nonrenewable resources currently used to generate electricity. In addition, Draft EIR Section 3.7, Greenhouse Gases and Climate Change, describes effects on climate change and greenhouse gas emissions that would be caused by implementation of the RESP, including a discussion on the effects of the projects on energy resources.

The County finds, based on the Draft EIR, the Final EIR, and the whole of Findings:

the record, that the proposed Program will result in less than cumulatively considerable impacts related to energy use.

#### 11.0 FINDINGS ON CHANGES TO THE EIR AND RECIRCULATION

CEQA Guidelines Section 15088.5 requires a lead agency to recirculate an EIR for further review and comment when significant new information is added to the EIR after public notice is given of the availability of a Draft EIR, but before certification. Such new information includes (i) significant changes to the project; (ii) significant changes in the environmental setting; or (iii) significant additional data or other information. Section 15088.5 further provides that "new information added to an EIR is not 'significant' unless the EIR is changed in a way that deprives the public of a meaningful opportunity to comment upon a substantial adverse environmental effect of the project or a feasible way to mitigate or avoid such an effect (including a feasible project alternative) that the project's proponents have declined to implement."

Chapter 3.0 of the Final EIR includes the a complete listing of all changes made to the RESP and the Draft EIR. The following is summary listing of corrections and clarifications made to the RESP and to the Draft EIR:

- Updates to clarify the role of the Agriculture Department and the Agricultural Preserve Review Committee in the review of RE projects.
- Update to specify allowance of RE projects on lands subject to Land Conservation Act
  contract, provided the property meets and maintains the current eligibility criteria in the
  Rules of Procedure, the project area does not exceed 10 percent of total acreage, and
  the project is no more than 10 acres in site area.
- Clarification to confirm the referral process for RE projects in the Camp Roberts Study Area and the maximum allowable height of WECS in the Camp Roberts Influence Areas.
- Updates to definitions for accessory REFs for consistency with current review and permitting, including an increase to the maximum size for accessory renewable energy-generating facilities from 0.5 acres to 3 acres.
- Confirmation that SEFs less than 20 acres in RSF, RMF, and RS zones will be subject to a minor use permit.
- Clarification that RE projects are not allowed in the Airport Review Combining Designation, except for accessory REFs.
- Clarification that Tier 1 SEF standards are the same within and outside of the Renewable Energy Combining Designation.
- Edits to criteria for accessory renewable energy-generating facilities to allow rooftop SEFs as accessory and to exclude rooftop WECS.
- Clarification to land uses considered accessory energy-generating facilities as defined in Article 8.
- Clarification of biological report requirements in the permit process for energygenerating facilities in Section 22.32.040.
- Corrections to references to the Land Use and Circulation Element and to sections of Title 22.
- Miscellaneous minor grammatical corrections and formatting corrections.

No new or substantial changes to the Draft EIR were proposed as a result of the public comment process. The Final EIR responds to comments and makes changes, clarifications, or additions to the Draft EIR in order to help clarify the project and its impacts in response to public or agency comments. The minor changes, clarifications, or additions to the Draft EIR do not identify any new significant impacts or substantial increase in the severity of any environmental impacts, and do not include any new mitigation measures that would have a potentially significant impact. Therefore, recirculation of the EIR is not required.

#### 12.0 FINDINGS ON MITIGATION MONITORING AND REPORTING PROGRAM

#### INTRODUCTION

Pursuant to CEQA and CEQA Guidelines Sections 15091(d) and 15097, the lead agency for a proposed project must adopt a program for monitoring or reporting mitigation measures identified in the EIR, if the lead agency makes findings of significant impacts during the process of certifying the EIR. The primary purpose of the Mitigation Monitoring and Reporting Program (MMRP) is to ensure that the mitigation measures identified in the EIR are implemented, thereby reducing or avoiding identified environmental impacts.

#### MITIGATION MONITORING AND REPORTING PROGRAM

The purpose of the Mitigation Monitoring and Reporting Program (MMRP) is to ensure the effective implementation of the mitigation measures imposed by the County for the proposed Program. In addition, the MMRP provides a means of identifying corrective actions, if necessary, before irreversible environmental damage occurs.

Due to the unique nature of the proposed Program, no mitigation measures were identified in the Draft EIR, and thus there is no MMRP. The County took an iterative approach to development of the performance standards included in the RESP. As each section of the code was completed, environmental analysis was conducted and then changes were made to the code to reduce or eliminate impacts that were identified. In essence, this program analysis and feedback loop constituted a comprehensive mitigation program where the proposed RESP was analyzed then revised to avoid or "mitigate" environmental impacts. The result is a "self-mitigating" program. Projects proposed under the program that cannot be fully mitigated per the criteria contained in the proposed Program would be required to complete a discretionary review process and comply with CEQA (and any project-specific mitigation measures and MMRP). This self-mitigating aspect is why there are no mitigation measures in the EIR. Any action that would be considered a mitigation measure for the Program is included as a performance standard.

While the RESP was under continual refinement, not all of the potential environmental impacts could be reduced to less than significant levels because mitigation measures were not available or appropriate for these impacts (see Sections 7.0 and 12.0 of these Findings for further details on these impacts and the infeasibility of mitigation measures).

#### 13.0 STATEMENT OF OVERRIDING CONSIDERATIONS

The Draft EIR includes thresholds of significance that are used to establish normally acceptable standards for County projects. In most instances, the proposed Program meets the standards without the need for modification. In three instances, the County finds that it is not feasible to reduce impacts to a level below the normally accepted thresholds, because to do so would defeat the primary objectives of the proposed Program. The CEQA Guidelines allow the County to approve the proposed Program with significant and unavoidable impacts, provided specific findings are made.

As such, pursuant to CEQA Section 21081(b) and CEQA Guidelines Section 15093, the County of San Luis Obispo has balanced the benefits of the proposed program against the following unavoidable adverse impacts relating to aesthetics and visual resources, agricultural resources, and land use and planning. The County has also examined alternatives to the proposed Program, none of which meets both the project objectives and is preferable to the proposed RESP.

The County has balanced the proposed Program's benefits against its significant and unavoidable impacts. The County finds that the proposed Program's benefits outweigh the RESP's significant and unavoidable impacts; those impacts therefore are considered acceptable in light of the proposed Program's benefits. The County finds that each of the following benefits is an overriding consideration that warrants approval of the proposed Program, notwithstanding the proposed Program's significant and unavoidable impacts. The benefits of the proposed Program include the following:

- Create a Renewable Energy (RE) Combining Designation that identifies locations where certain renewable solar electric facilities will qualify for permit streamlining if they meet specified standards and conditions for project size, site characteristics, and environmental protections.
- Revise the Land Use Ordinance to foster permit streamlining for other specified types of renewable energy facilities throughout the non-Coastal Zone portions of the unincorporated county (both within and outside of the RE Combining Designation).
- Support achievement of the County's goal to increase the production of renewable energy from small- and commercial-scale energy installations to account for 10 percent of total local energy by 2020 as presented in the County EnergyWise Plan.
- Provide a clear process and expectations for renewable energy projects in suitable locations that minimize environmental impacts.

#### **CONCLUSION**

CEQA requires the County to balance, as applicable, the economic, legal, social, technological, or other benefits, including region-wide or statewide environmental benefits, of the proposed RESP against its significant and unavoidable environmental risks when determining whether to approve the proposed Program. If the specific economic, legal, social, technological, or other benefits, including region-wide or statewide environmental benefits, of the proposed RESP outweigh the unavoidable adverse environmental effects, the adverse environmental effects may be considered "acceptable" and the proposed Program approved.

In addition to the CEQA requirement, the San Luis Obispo County Conservation and Open Space Element (COSE) also strives to conserve and protect important natural resources while balancing the needs of the natural and built environments. Two of the four essential priority actions require a reduction of greenhouse gas emissions and an increased use of renewable energy. This Program specifically addresses these priorities while at the same time requiring avoidance of sensitive resources.

The County of San Luis Obispo would adopt a Program that would provide a clear process and expectations for renewable energy projects in suitable locations. In order to achieve this, a Renewable Energy (RE) Combining Designation would be created. This would identify locations where certain renewable solar electric facilities will qualify for permit streamlining if they meet specific standards and conditions. Additionally, the Land Use Ordinance would be revised to foster permit streamlining for other specific types of renewable energy facilities throughout the non-Coastal Zone portions of the unincorporated county (both within and outside of the RE Combining Designation).

The end result is that the Program seeks to achieve the County's goal to increase the production of renewable energy from small- and commercial-scale energy installations to account for 10 percent of total local energy by 2020. Additionally, although significant and unavoidable

impacts have been identified for aesthetics and visual resources, agricultural resources, and land use and planning, because site-specific project details are unknown at this time, impacts disclosed may be conservative in nature and, in practice, would result in impacts that are significantly less than what was analyzed in the EIR.

The distributed generation of energy for local use will reduce the need to import energy from outside of the region that may be generated by methods which generate greenhouse gas. Larger projects resulting from the Program will reduce or delay the need to construct new power plants locally or the need to develop new transmission lines to serve the county.

As many of the projects will be small and distributed throughout a large area of the county, local contractors would be expected to install, manage, and maintain the SEF and WECS equipment. This will create work for existing local businesses and may create the potential for additional jobs in the growing renewable energy industry. Once more of the projects are developed, San Luis Obispo County will emerge as a leader in the renewable energy field, creating opportunity not only for the installation but for the manufacturing of equipment designed to meet local renewable energy needs.

The County has already had some success with the installation of renewable energy projects for local farms. Adoption of the Program will lessen the regulatory burden faced by agricultural uses for the installation of renewable energy equipment. By making it easier to install and use this equipment, the Program will help reduce energy costs, thereby supporting the existing agricultural use and discouraging the irreversible conversion of agricultural land to nonagricultural uses.

After balancing the specific economic, legal, social, technological, and other benefits of the proposed Program, the County has determined that the identified significant and unavoidable impacts are considered acceptable due to the specific considerations listed above that outweigh them. Accordingly, the County adopts the Statement of Overriding Considerations, recognizing that significant and unavoidable impacts would result from implementation of the proposed RESP.

Having (1) adopted all feasible mitigation measures, (2) rejected alternatives to the proposed Program, and (3) recognized all unavoidable significant impacts, the County hereby finds that each of the separate benefits of the proposed RESP, as stated herein, is determined to be unto itself an overriding consideration, independent of other benefits, that warrants approval of the proposed Program and outweighs and overrides its significant and unavoidable impacts, and thereby justifies the approval of the Renewable Energy Streamlining Program.

# **FINDINGS**

- A. The proposed amendments are consistent with the Land Use Element and other adopted elements of the general plan because the Renewable Energy Streamlining Program (RESP) will: 1) implement policies of the Conservation and Open Space Element (COSE) to encourage and streamline the development of distributed generation renewable energy projects; 2) create a Renewable Energy Combining Designation as directed by implementation strategies of the COSE; and 3) remove obstacles to the development of distributed generation renewable energy projects, consistent with balancing the development of renewable energy projects with the protection of natural resources as directed by the COSE.
- B. The proposed amendments will streamline the permitting and development of certain renewable energy projects by:
  - 1. Providing for a ministerial Site Plan Review permitting process for distributed generation renewable energy projects that meet rigorous performance standards that ensure protection of natural resources;
  - Providing a Programmatic Environmental Impact Report that can be used to evaluate environmental effects of renewable energy projects in place of individual, time consuming environmental review of projects; and
  - 3. Allowing renewable energy projects subject to streamlining in areas where these projects were previously not allowed by planning area standards.
- C. The proposed amendments will protect the public health, safety and welfare of the area residents by:
  - 1. Providing for rigorous performance standards in order for renewable energy projects to be approved through a streamlined permit process;
  - Protecting agricultural resources while at the same time allowing small renewable energy projects to be considered on contracted land, consistent with the Land Conservation Act; and
  - 3. Providing for adequate screening of proposed renewable energy projects from public views, and protecting important biological, cultural and soil resources while encouraging the development of distributed generation renewable energy projects.

Highlights indicate a change from the November 17, 2014 Public Review Draft RESP

# Exhibit LRP 2014-00015:C Amendments to the Land Use and Circulation Elements and the Conservation and Open Space Element of the County General Plan

I. Amend the Land Use and Circulation Elements of the County General Plan, Framework for Planning (Inland), Chapter 7, page 7-1 as follows:

#### A. COMBINING DESIGNATIONS

# **Summary of Designations**

The LUE uses the following ten nine combining designations: [Amended 1996, Ord. 2776]

- **AR Airport Review**: Applied to areas identified in the various county airport land use plans where proposed developments receive special review (to avoid land uses incompatible with airport operations), as well as areas within airport approach and departure patterns.
- **GSA Geologic Study Area**: Applied to: areas identified in the Alquist-Priolo Geologic Hazard Zones Act as "Special Studies Zone" (Public Resources Code Section 2622); to areas within urban and village reserve.
- II. Amend the Land Use and Circulation Elements of the County General Plan, Framework for Planning (Inland), Chapter 7, page 7-2 to insert the following combining designation definition following the Extractive Resource Area summary:
  - **EX1** Extractive Resource Area: Applied to areas, including active mines, which the California Department of Conservation's Division of Mines and Geology has classified as containing or being highly likely to contain significant mineral deposits. Any such areas which are subsequently formally designated by the State as containing mineral deposits of statewide significance should be included in the EX combining designation subject to an amendment of the Land Use Element [Amended 1991, Ord. 2498].
    - NOTE: The classification information developed by the State is contained in a report titled "Special Report 162, Mineral Land Classification of Portland Cement Concrete Aggregate and Active Mines of All Other Mineral Commodities in the San Luis Obispo Santa Barbara Production-Consumption Region, 1989." That report, together with the accompanying classification maps, are incorporated by reference herein as though set forth in full [Amended 1991, Ord. 2498].
  - Renewable Energy Area: Applies to areas where renewable energy production is favorable and prioritized. Within these areas, the County encourages distributed renewable energy development by streamlining permit requirements and environmental review in a manner that would not degrade ecosystems, agricultural resources, and other environmental resources...

III. Amend the Land Use and Circulation Elements of the County General Plan, Framework for Planning (Inland), Chapter 7, page 7-10 to insert the description of the proposed renewable energy combining designation following the description of the TDCS/TDCR Transfer of Development Credits-Sending and Receiving Sites description as follows:

#### **RE - RENEWABLE ENERGY AREAS**

## **Purpose**

- 1. To encourage and support the development of local renewable energy resources, conserving energy resources and decreasing reliance on environmentally costly energy sources.
- 2. To identify areas of the county where: (1) renewable energy production is favorable, (2) the production of distributed renewable energy resources is prioritized, and (3) permit requirements are structured to streamline the environmental review and processing of land use permits for solar electric facilities (SEFs).
- 3. To protect the development and use of locally appropriate distributed renewable energy resources in priority areas in a manner that will not degrade ecosystems, agricultural resources, and other environmental resources.
- 4. To notify landowners and the general public of areas where development of renewable energy resources is prioritized.

#### **General Objectives**

The Land Use Ordinance should provide detailed criteria for the review and processing of renewable energy projects to achieve the following objectives:

- 1. Where feasible, standards should simplify and streamline the land use permit and environmental review process for renewable energy facilities.
- 2. <u>Performance standards for renewable energy facilities shall protect environmental resources, agricultural resources, and surrounding communities.</u>
- IV. Amend the Land Use and Circulation Elements of the County General Plan (Inland, Part II), The Area Plans, Carrizo Area Plan, Section 6.2, Area Plan Combining Designations, Page 11.6-2 to add the Renewable Energy combining designation as follows:
  - 9. Renewable Energy (RE). Identifies areas where renewable energy production is favorable and prioritized. Within these areas, the County encourages distributed renewable energy development by streamlining permit requirements and environmental review in a manner that would not degrade ecosystems, agricultural resources, and other environmental resources.

V. Amend the Land Use and Circulation Elements (Inland, Part II) of the County General Plan, The Area Plans, North County Area Plan, Section 6.2, Area Plan Combining Designations, Page III.6-10, to add the Renewable Energy combining designation as follows:

# Transfer of Development Credits Receiving Site

- 56. Smith Property Transfer of Development Credits Receiving Site (TDCR). A parcel map (CO 98-194, Smith) has been recorded on this site located at the intersection of El Pomar Drive and Moss Lane. This parcel map was approved as a receiving site for transfer of development credits (TDCs) in accordance with the Land Use Ordinance.
- 57. Spanish Lakes Transfer of Development Credits Receiving Site (TDCR). A cluster subdivision (Tract 2308, Spanish Lakes) has been recorded on a site located between Creston Road and South River Road, south of Paso Robles. This tract was approved as a receiver site for transfer of development credits (TDCs) in accordance with the Land Use Ordinance, and the TDCs were used to achieve higher density than would otherwise be allowed for the applicable land use category.

# Renewable Energy (RE)

- 58. Renewable Energy (RE). Identifies areas throughout the North County Planning Area where renewable energy production is favorable and prioritized. Within these areas, the County encourages distributed renewable energy development by streamlining permit requirements and environmental review in a manner that would not degrade ecosystems, agricultural resources, and other environmental resources.
- VI. Amend the Land Use and Circulation Elements (Inland, Part II) of the County General Plan, The Area Plans, San Luis Obispo Area Plan, Section 6.2, Area Plan Combining Designations, Page IV.6-6, to add the Renewable Energy combining designation as follows:

# Renewable Energy (RE)

1. Renewable Energy (RE). Identifies areas throughout the San Luis Obispo Planning Area where renewable energy production is favorable and prioritized. Within these areas, the County encourages distributed renewable energy development by streamlining permit requirements and environmental review in a manner that would not degrade ecosystems, agricultural resources, and other environmental resources.

VII. Amend the Land Use and Circulation Elements (Inland, Part II) of the County General Plan, The Area Plans, South County, Section 6.2, Area Plan Combining Designations, V.6-1, to add the summary of the Renewable Energy combining designation as follows:

# 6.2 Area Plan Combining Designations

The following combining designations are located within the South County Planning Area:

# **Summary of Combining Designations**

The Land Use Element uses the following seven combining designations inland of the coastal zone. Some combining designations are not applicable to the South County Planning Area:

- **AR** Airport Review: Special review areas that are identified in the various County and Paso Robles airport land use plans where proposed developments are reviewed to avoid land uses incompatible with airport operations.
- **GSA** Geologic Study Area: Areas within urban and village reserve lines that are subject to "moderately high to high" landslide risk or liquefaction potential; and to land outside urban reserve lines subject to high landslide risk potential, according to the Seismic Safety Element.
- **FH** Flood Hazard: Flood-prone areas identified through review of available data from various federal, state or local agencies.
- H Historic Site: Areas of unique historical significance.
- **SRA** Sensitive Resource Area: Areas having high environmental quality and special ecological or educational significance.
- **EX** Energy or Extractive Area: Areas where oil, gas or mineral extraction occurs, is proposed or where the State Geologist has identified petroleum or mineral reserves of statewide significance, and areas of existing or proposed energy-producing facilities.
- **EX1** Extractive Resource Area: Areas, including active mines, that the California Department of Conservation's Division of Mines and Geology has classified as containing or highly likely to contain significant mineral deposits.
- RE Renewable Energy Area: Areas with potential for renewable energy development in order to prioritize such development and provide streamlined permit requirements.

VIII. Amend the Land Use and Circulation Elements (Inland, Part II) of the County General Plan, The Area Plans, South County Area Plan, Section 6.2, Area Plan Combining Designations, IV.6-6, to add the Renewable Energy combining designation as follows:

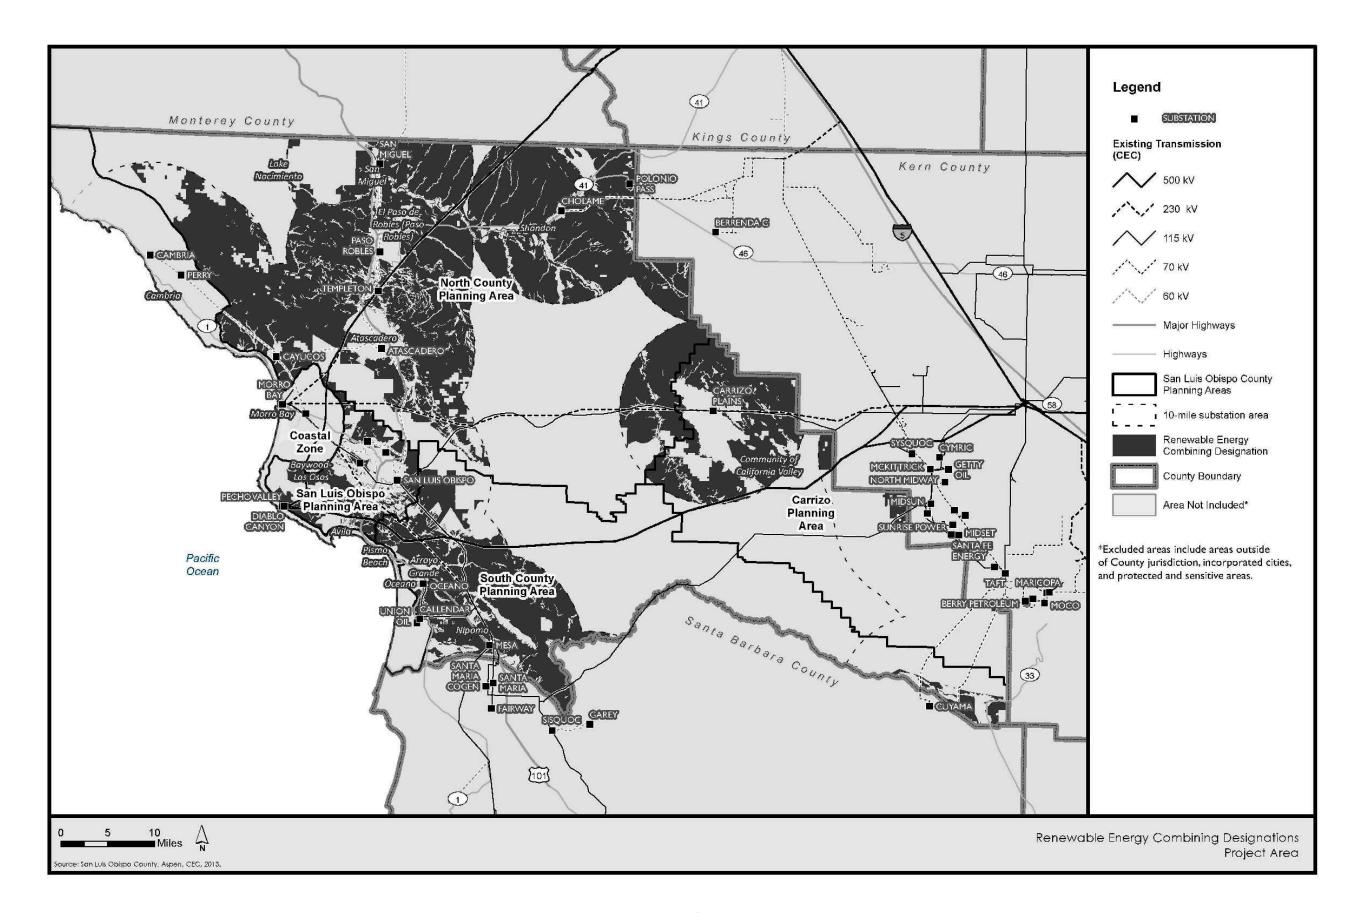

# Transfer of Development Credits Site (TDCS)

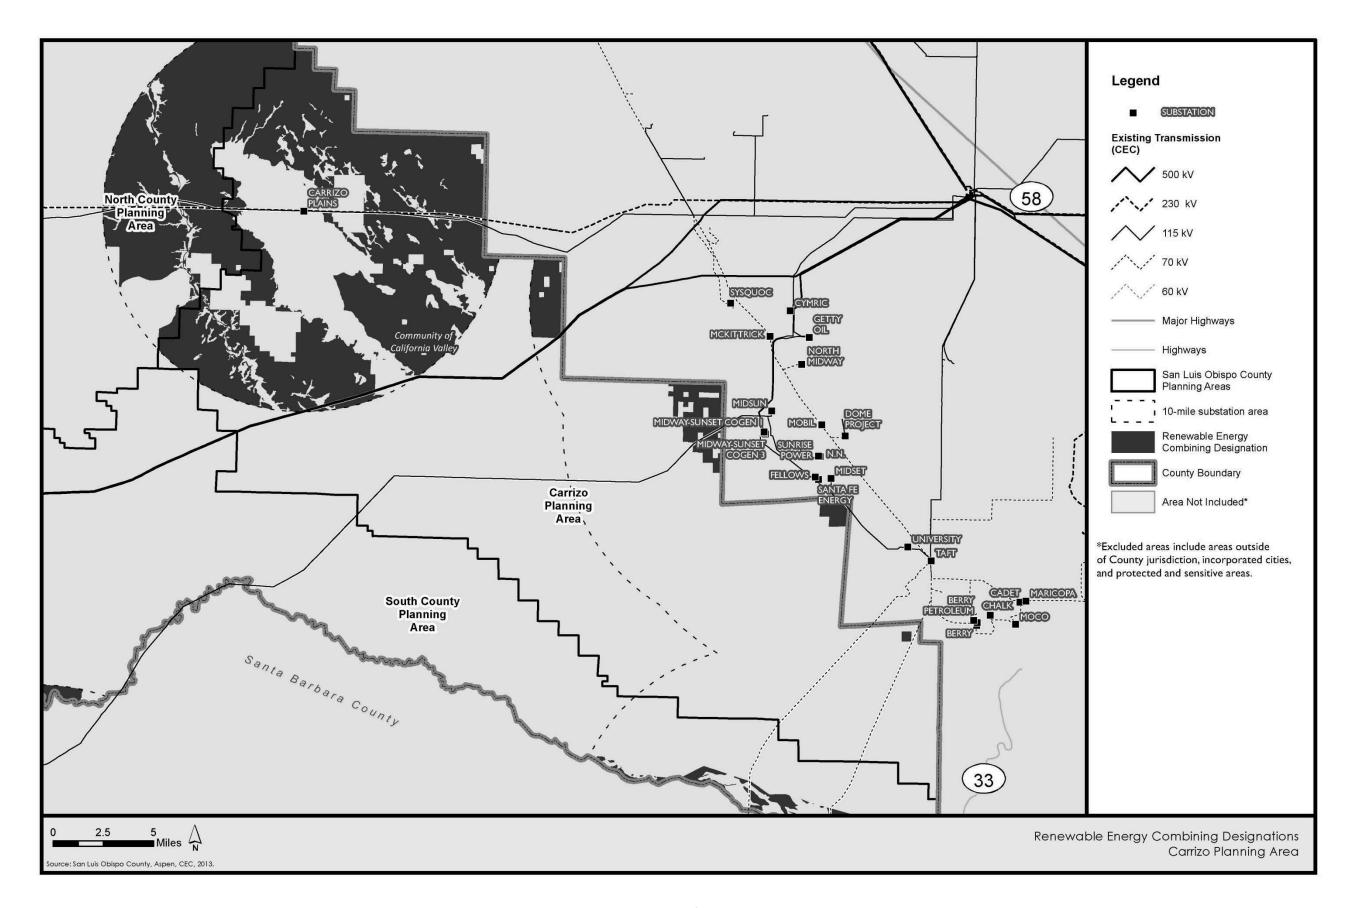

- 1. **Nipomo Bluffs (TDCR).** The area defined by 1996 Assessor Parcel Numbers 092-021-035 and 092-031-018, 019, commonly referred to as the Nipomo Bluffs project, has been determined to be eligible to be considered for the Transfer of Development Credit Receiving Site (TDCR) Combining Designation. A determination on the density shall occur during review of a tentative map by the Review Authority.
- 2. Black Lake Specific Plan (TDCR). The area defined in the Black Lake Specific Plan, has been determined to be eligible to be considered for the Transfer of Development Credit Receiving Site (TDCR) Combining Designation. Specific density, use and permit requirements are set forth in the Specific Plan.
- 3. Black Lake Canyon (TDCS). The narrow marsh extending inland from Dune Lakes has been determined to be eligible to be considered for the Transfer of Development Credit Sending Site (TDCS) Combining Designation. Sites in this area shall only be reviewed as to method of determining development value and issuance of bonus credits by the Review Authority. The guarantee of conservation shall be based on the method that would otherwise have been used to determine eligibility as a sending site.

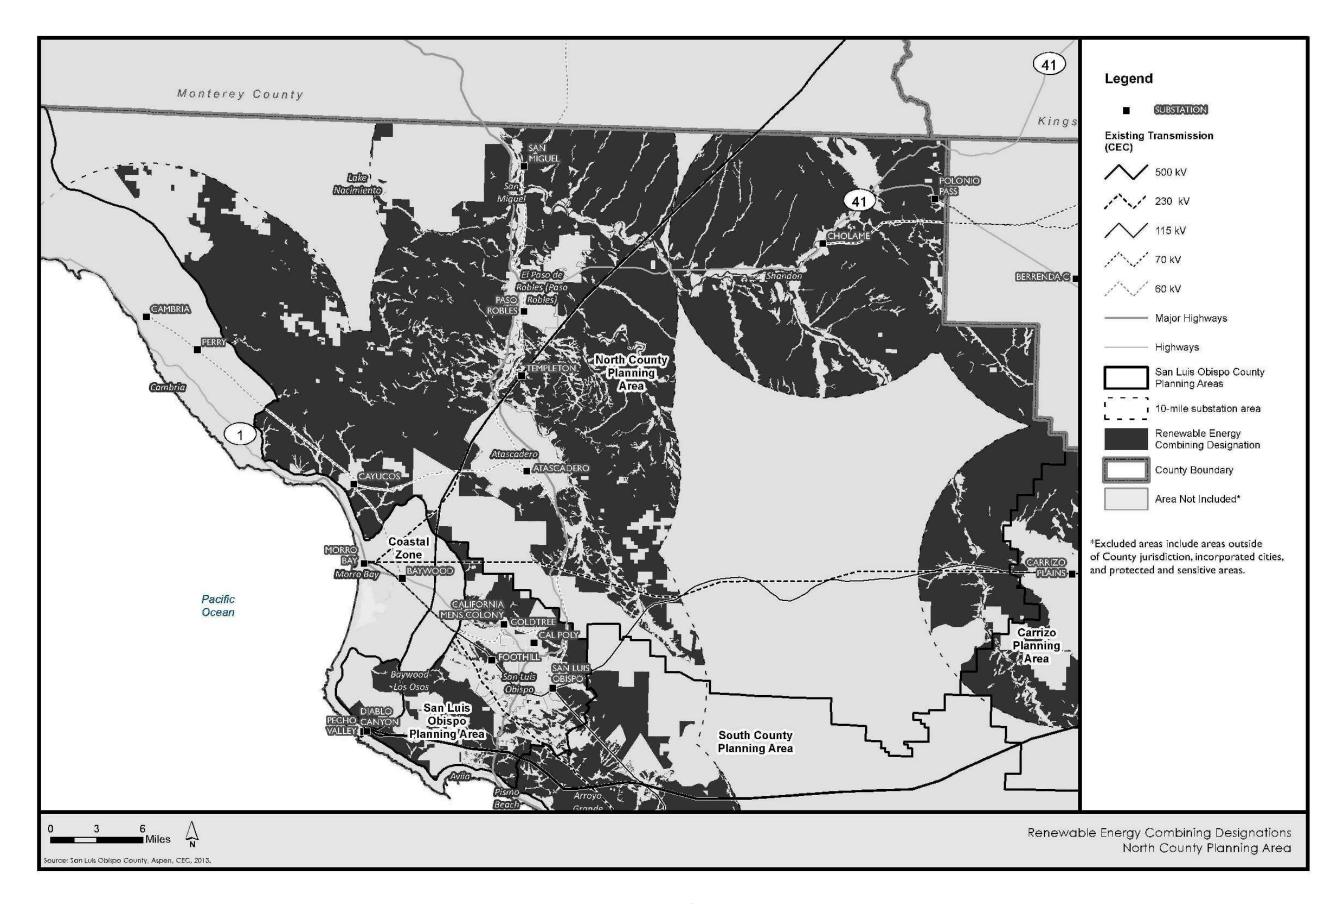

#### Renewable Energy (RE)

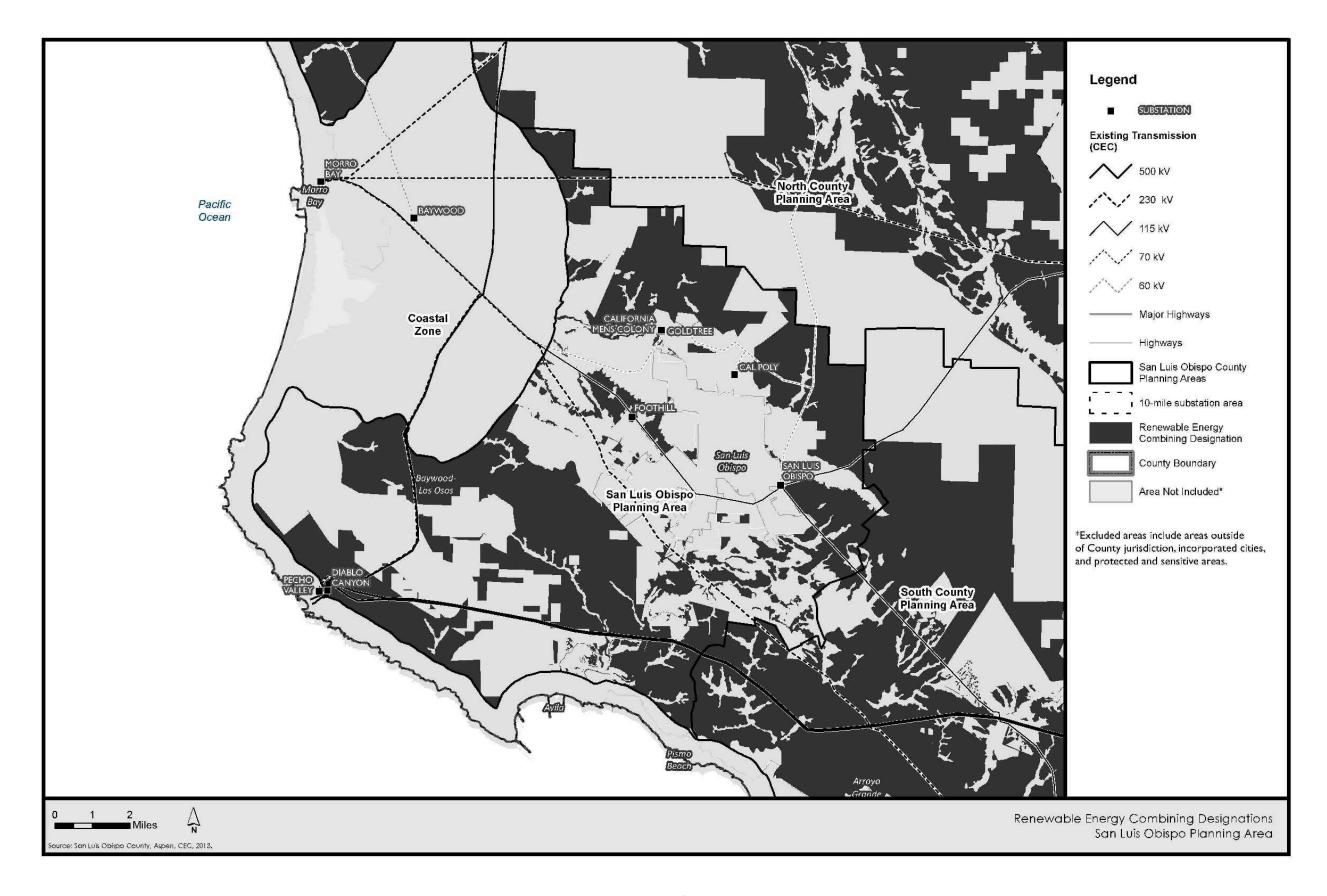

Renewable Energy (RE). Identifies areas throughout the South County Planning Area where renewable energy production is favorable and prioritized. Within these areas, the County encourages distributed renewable energy development by streamlining permit requirements and environmental review in a manner that would not degrade ecosystems, agricultural resources, and other environmental resources.

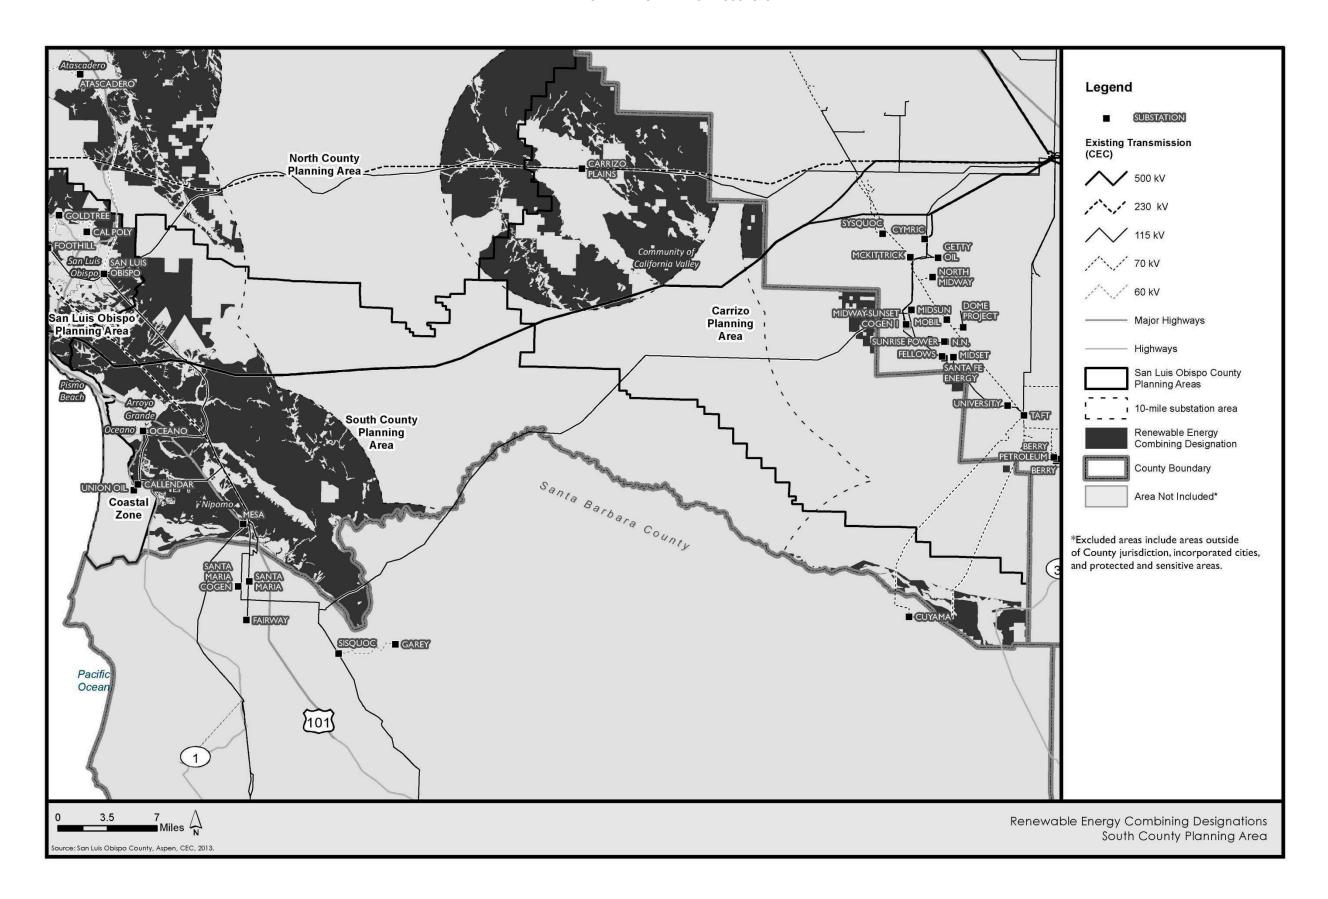

IX. Amend the Land Use and Circulation Elements of the County General Plan, The Area Plans Official Maps (Inland, Part HIV). The following maps of the Renewable Energy Combining Designation will be added to the Element.

# X. Amend the Conservation and Open Space Element of the County General Plan, Energy Chapter, Page 5-21 as follows:

Policy E 6.2 Commercial solar and wind power and other renewable energy systems
Encourage and support the development of solar and wind power and other renewable energy systems as commercial energy enterprises.

# Implementation Strategy E 6.2.1 Review of large solar projects

Evaluate large-scale commercial solar projects (i.e. over <u>20</u> <del>10</del>-MW) to favor technologies that maximize the facility's power production and minimize the physical effects of the project. Physical effects include, but are not limited to, noise, area of land disturbance and water use.

# XI. Amend the Conservation and Open Space Element of the County General Plan, Energy Chapter, Page 5-22, Text Box, as follows.

Distributed energy resources (DER) are small, modular, energy generation and storage technologies that provide electric capacity or energy located where it's needed, often at a customer's location. These facilities are typically owned by non-utility entities, such as generation developers or utility customers that offset all or part of the customer's on-site electrical load. DER's typically produce less than 20 10 megawatts (MW) of power near the point of use and include wind turbines, photovoltaics (PV), fuel cells, microturbines, reciprocating engines, combustion turbines, cogeneration, and energy storage systems. DER systems may be either connected to the local electric power grid or isolated from the grid in stand-alone applications. — California Energy Commission

# XII. Amend the Conservation and Open Space Element of the County General Plan, Energy Chapter, Page 5-23 as follows:

Policy E 6.8 Renewable Energy Resources

Designate and protect areas that contain renewable energy resources such as wind, solar, geothermal, and small hydroelectric. <u>Continue to explore and encourage the development of renewable energy resources through further streamlining actions.</u>

#### Implementation Strategy E 6.8.1 Mapping of resources

Use state, federal, or other available data to map areas that contain renewable energy resources.

# Implementation Strategy E 6.8.2 Streamlining of Renewable Energy Facilities

**a.** Encourage further broad-based environmental review for renewable energy projects that can be used to streamline the approval of future projects.

Revise existing streamlining efforts in the future as major technological changes occur.

Amend the Framework for Planning, the Area Plans, and the Land Use Ordinance (LUO) by establishing and applying a Renewable Energy (RE) combining designation based on the

mapping in Energy Implementation Strategy 6.8.1. The RE designation and implementing LUO standards are to:

- b. Encourage the development of renewable energy while maintaining a high level of environmental quality;
- **c.** Avoid areas that are not appropriate for renewable energy due to existing incompatible uses; and
- d. Protect areas of renewable energy resources, as well as existing and expanding renewable energy projects, from encroachment by incompatible land use categories and development.

XIII. Amend the Conservation and Open Space Element of the County General Plan, Energy Chapter, Page 5-35, Table E2 as follows:

Implementation Strategies	Responsible Department or Agency <sup>1</sup>	Priority	Timeframe to Start	Possible Funding Sources <sup>2</sup>
IS E 6.8.2 <u>Streamlining energy</u> combining designations of Renewable <u>Energy Facilities</u>	PB	High	2010	DB, grants

# XIV. Amend the Conservation and Open Space Element of the County General Plan, Glossary, Page 12-5 as follows:

Distributed Energy Resources (DER): Small, modular, energy generation and accessory storage technologies that provide electric capacity or energy located where it's needed, often at a customer's location or close to a load center. These facilities are typically owned by non-utility entities, such as generation developers or utility customers that offset all or part of the customer's on-site electrical load. DER's typically produce less than 20 40 megawatts (MW) of power near the point of use and include wind turbines, photovoltaics (PV), fuel cells, microturbines, reciprocating engines, combustion turbines, cogeneration, and energy storage systems. DER systems may be either connected to the local electric power grid or isolated from the grid in stand-alone applications.

# XV. Amend the Conservation and Open Space Element of the County General Plan, Glossary, Page 12-14 is proposed to be amended as follows:

**Renewable energy:** Energy from sources that regenerate and are less damaging to the environment, <u>including but not limited to such as</u> solar, wind, biomass, and small-scale hydroelectric power.

XVI. Amend the Conservation and Open Space Element of the County General Plan, Glossary, Page 12-16 as follows:

<u>Utility-Scale Renewable Energy Resources:</u> Large energy generation and storage technologies that are connected to the electric power grid and that generate electricity or energy primarily for off-site use producing more than 20 megawatts (MW) of power. Technologies may include wind turbines, photovoltaics, fuel cells, microturbines, reciprocating engines, combustion turbines, cogeneration, and energy storage

Highlights indicate changes from the November 27, 2014 Public Review Draft RESP

<b>ORDINA</b>	NCE NO	

## AN ORDINANCE AMENDING THE LAND USE ORDINANCE, TITLE 22 OF THE SAN LUIS OBISPO COUNTY CODE, RELATIVE TO THE RENEWABLE ENERGY STREAMLINING PROGRAM (RESP)

The Board of Supervisors of the County of San Luis Obispo ordains as follows:

<u>SECTION 1</u>: Section 22.04.030, Table 2-1 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

TABLE 2-1 LAND USE CATEGORIES AND COMBINING DESIGNATIONS

Map Symbol	Land Use Category Name						
, , , , , , , , , , , , , , , , , , ,	Agricultural and Rural Categories						
AG	Agriculture						
RL	Rural Lands						
Residential Categ	ories						
RR	Residential Rural						
RS	Residential Suburban						
RSF	Residential Single-Family						
Commercial and l	ndustrial Categories						
OP	Office and Professional						
CR	Commercial, Retail						
CS	Commercial, Service						
IND	Industrial						
Special Purpose C	Categories						
OS	Open Space						
REC	Recreation						
PF	Public Facilities						
Combining Designations							
AR	Airport Review Area						
EX	Energy and Extractive Resource Area						
EX1	Extractive Resource Area						
FH	Flood Hazard						

Map Symbol	Land Use Category Name
GSA	Geologic Study Area

LCP	Local Coastal Plan Area
<u>RE</u>	Renewable Energy Area
SRA	Sensitive Resource Area
TDCR	Transfer of Development Credit Receiving Site
TDCS	Transfer of Development Credit Sending Site

<u>SECTION 2</u>: Section 22.06.030A of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

- **A. Permit requirements.** Table 2-2 provides for land uses that are:
- 1. Allowed subject to the approval of the land use permit required by Section 22.08.030 (Project-Based Permit Requirements). These are shown as "A1" uses in the table;
- 2. Allowed subject to the approval of the land use permit required for the particular use by Article 4 (Standards for Specific Land Uses). These are shown as "A2" uses in the table;
- 3. Permitted subject to the approval of a Zoning Clearance (Section 22.62.030). These are shown as "P" uses in the table;
- 4. Permitted subject to the Site Plan Review approval (Section 22.62.040). These are shown as "SP" uses in the table;
- 5. Allowed subject to the approval of a Minor Use Permit (Section 22.62.050). These are shown as "MUP" uses in the table; and
- 6. Allowed subject to the approval of a Conditional Use Permit (Section 22.62.060). These are shown as "CUP" uses in the table.

**Note:** where the last column ("Specific Use <u>Standards Regulations</u>") in Table 2-2 includes a section number, the regulations in the referenced section apply to the specific use; however, the provisions of Article 3 (Site Planning and General Development Standards) shall also apply.

<u>SECTION 3</u>: Section 22.06.030.C of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

- **C. Uses not listed.** A land use that is not listed in Table 2-2 or is not shown in a particular land use category is not allowed, except <u>as follows</u>, or as otherwise provided by Section 22.06.040 (Exemptions from Land Use Permit Requirements).
- 1. Where a proposed land use is not specifically listed in Table 2-2, the Director will review the proposed use when requested to do so by letter and, based upon the characteristics of the use, determine whether any of the listed uses is equivalent to that proposed.

- 2. Upon a written determination by the Director that a proposed unlisted use is equivalent in its nature and intensity to a listed use, the proposed use will be treated in the same manner as the listed use in determining where it is allowed, what permits are required, and what standards affect its establishment.
- 3. Determinations that specific unlisted uses are equivalent to listed uses will be recorded by the Department, and will be considered for incorporation into the this Title through amendment as soon as is practical.
- 4. At the discretion of the Director, allowable use interpretation requests may be forwarded to the Commission for determination. Determinations by the Director may be appealed to the Commission in compliance with Section 22.70.050.
- 5. If a proposed use is found by the review authority to not be equivalent to any listed use, the proposed use shall be deemed not allowed.

[22.01.041.d]

SECTION 4: Section 22.06.030.C, Table 2-2 for Agricultural, Resource, and Open Space Uses of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

TABLE 2-2 ALLOWABLE LAND USES AND PERMIT REQUIREMENTS

<u>SECTION 5</u>: Section 22.06.030.C, Table 2-2 for Agricultural, Resource, and Open Space Uses of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended by adding a new footnote (9) as follows:

(9) This use may not be allowable in every land use category. Refer to the standards in Chapter 22.32.

<u>SECTION 6</u>: Section 22.08.030, Table 2-3 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

TABLE 2-3
PERMIT REQUIREMENTS BASED ON PROJECT CHARACTERISTICS

Land Use or		Permit Requirement						
Development Characteristic	Criteria (1)	Zoning Clearance	Site Plan Review	Minor Use Permit	Conditional Use Permit			
Dwellings	Number of proposed single- or multi- family dwellings per site (2)	4 or fewer	5 to 15	16 to 24	25 or more			
Manufacturing & Processing, Outdoor Storage (3)	Gross floor area or outdoor use area	Less than 10,000 sf, or change in "A1" uses (5)	10,000 sf to 19,999 sf	20,000 sf to 39,999 sf	40,000 sf or more			
Retail Trade, Services, and all other	Gross floor area or outdoor use area	Less than 2,500 sf, or change in "A1" uses (5)	2,500 sf to 9,999 sf	10,000 sf to 19,999 sf	20,000 sf or more			
nonresidential use groups (4)	and traffic circulation	with no drivein or drivethrough	and/or drivein or drivethrough	and/or drivein or drivethrough				

Land Use or		Permit Requirement						
Development Characteristic	Criteria (1)	Zoning Clearance	Site Plan Review	Minor Use Permit	Conditional Use Permit			
		or drivethrough						
Site Disturbance	Area per site of grading requiring a permit, or removal of native vegetation (6)	Less than 1 acre (6Z)	N.A. (67)	1 to 3 acres	More than 3 acres			
Impervious Surface	Area per site of site coverage by paving and structures 6	Less than 1 acre	N.A. (67)	1 to 3 acres	More than 3 acres			

#### Notes:

- (1) All criteria are cumulative for a single site (e.g. a proposed 3-unit expansion of an existing 39 unit apartment requires Conditional Use Permit approval).
- (2) Or number of dwellings proposed to be constructed by a single developer, in a single subdivision that was recorded before March 19, 1962.
- (3) Includes all uses listed under the Manufacturing & Processing land use group by Table 2-2, and the specific use identified by Table 2-2 as Storage Yards and Sales Lots.
- (4) Includes all uses listed under the Retail Trade, Services, and all other land use groups by Table 2-2, except Residential, Manufacturing & Processing, and Outdoor Storage.
- (5) When an allowed use (an "A1" use in Table 2-2) in an existing building is to be replaced with another allowed use that is required by Chapter 22.18 to have equal or less parking than the use being replaced, approval of a Zoning Clearance is required regardless of what permit was necessary for the original building, provided the building satisfies all applicable provisions of Chapter 22.72 (Nonconforming Buildings, Structures, Parcels, and Signs).
- (6) Permit requirements and site disturbance characteristics for energy-generating facilities are identified in Chapter 22.32 (Energy-Generating Facilities).
- (67) A grading permit, drainage plan review, or erosion and sedimentation plan review may be required by Chapter 22.52 (Grading and Drainage); and/or construction permits may be required by the Building and Construction Ordinance, Title 19 of this Code.
- <u>SECTION 7</u>: Section 22.10.090.C.2.c.8 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:
  - (8) Solar collectors. Solar electric facilities and wind energy conversion systems may exceed Not more than five feet above the height limits specified in Subsection C.1 up to the maximum limits established in Chapter 22.32 for the proposed project.

<u>SECTION 8</u>: Section 22.10.140.A of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended by adding a new Section 22.10.140.A.5 as follows:

5. Solar electric facilities, wind energy conversion systems, and other renewable energy facilities as allowed by Chapter 22.32 (Energy-Generating Facilities) with special setback standards. Where Chapter 22.32 establishes larger setback requirements than those identified in this Chapter, the larger setbacks shall apply.

<u>SECTION 9</u>: Section 22.10.140.H of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended by adding a new Section 22.10.140.H.5 as follows:

5. Solar electric facilities, Tier 1. Tier 1 roof-mounted solar electric facilities as described by Section 22.32.050 (Solar Electric Facilities) of this Title not exceeding 10 feet in height may project into the required setback up to 15 feet, and no closer than 3 feet to the property line.

SECTION 10: Chapter 22.14 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended by adding a new Section 22.14.100 as follows:

## 22.14.100 - Renewable Energy (RE) Area

- A. Purpose. The Renewable Energy (RE) Combining Designation is used to encourage and support the development of local renewable energy resources, conserving energy resources and decreasing reliance on environmentally costly energy sources. Specifically, the purpose of the RE Combining Designation is to:
  - 1. <u>Identify areas of the county where:</u> (1) renewable energy production is favorable, (2) the production of renewable energy resources is prioritized, and (3) permit requirements are structured to streamline the environmental review and processing of land use permits for solar electric facilities (SEFs).
  - 2. Protect the development and use of locally appropriate distributed renewable energy resources in priority areas in a manner that will not degrade ecosystems, agricultural resources, and other environmental resources.
  - 3. <u>Notify landowners and the general public of areas where development of renewable energy resources is prioritized.</u>

This combining designation does not limit the development of SEFs outside of this combining designation where it is an allowable use identified in Section 22.06.030 (Allowable Land Uses and Permit Requirements) and regulated by the special use standards in Chapter 22.32 (Energy-Generating Facilities).

#### B. Applicability.

1. The permit requirements of this Section shall apply only to proposed SEFs meeting the site criteria of this Section. Where other accessory or primary uses are proposed that indirectly support proposed SEFs, the applicable permit requirements for the additional use(s) shall be determined as described in Chapter 22.06 (Allowable Land Uses and Permit Requirements by Land Use Category). For purposes of determining

permit requirements and standards as established by this Section, the size of the SEF shall be measured as the total area of the facility inclusive of components and subsystems that, in combination, convert or store solar energy into electric energy suitable for use, unless otherwise noted, inclusive of components and subsystems that, in combination, convert or store solar energy into electric energy suitable for use. The size of ground-mounted SEF shall be measured as directed by Section 22.32.030.A. Where other accessory or primary uses are proposed that indirectly support proposed SEFs, the applicable permit requirements for the additional use(s) shall be determined as described in Chapter 22.06 (Allowable Land Uses and Permit Requirements by Land Use Category).

- 2. Land Conservation Act. Permit requirements of this Section (22.14.100) shall apply to proposed SEFs on land subject to a Land Conservation Act contract within an RE Combining Designation as follows.
  - a. <u>If a proposed SEF is greater than 20 acres in total area within an RE Combining Designation and is subject to a Land Conservation Act Contract:</u>
    - (1) The project shall be ineligible for the permit requirements established by this Section (22.14.100) but may elect to comply with standards of this section to streamline other aspects of project review.
    - (2) The project shall require a Minor Use Permit (or Conditional Use Permit if otherwise required by Chapter 22.32 or the County's Rules of Procedure to Implement The California Land Conservation Act of 1965 (Table 2)).
    - (3) The project shall comply with the County's Rules of Procedure to Implement The California Land Conservation Act of 1965 (Table 2), individual Contracts, the provisions of the Land Conservation Act itself Williamson Act itself and any changes that may be made to it.
    - b. If a proposed SEF is 20 acres or less in total area and subject to a Land Conservation Act contract Contract within an RE Combining Designation, the project is allowable in all land use categories if the proposed SEF meets the site eligibility criteria for Tier 1 SEFs in Chapter 22.32 (Energy-Generating Facilities).
    - c. If a proposed SEF is 20 acres or less in total area and subject to a Land Conservation Act contract within an RE Combing Designation, but is when inconsistent with the site eligibility criteria for Tier 1 SEFs, the project may qualify as Tier 2 or Tier 3 SEF if the proposed SEF meets the site eligibility criteria established in this Section (22.14.100).

- 3. The standards of this Section shall not apply to proposed SEFs that meet the following criteria. When a proposed SEF does not meet any of the following criteria, the project shall be subject to permit requirements of Chapter 22.32 (Energy-Generating Facilities) or other applicable sections of this Title:
  - a. <u>Include energy transmission or distribution facilities within an RE Combining Designation and involve easements over parcels outside of an RE Combining Designation.</u>
  - b. Require new transmission lines to tie in to the electric grid.
  - c. Are considered accessory energy-generating facilities or Tier 1 solar electric facilities, which are allowable uses as regulated by Chapter 22.32 (Energy-Generating Facilities).
  - d. Sited on Class I or Class II soils, consistent with the areas included in the RE Combining Designation map established by Part III of the Inland Framework for Planning Land Use Element.
  - e. Located within visual Sensitive Resource Areas.
  - f. Parcels subject to conservation easements that prohibit energy-generating facilities.
  - g. Parcels in the Recreation (REC), -and-Open Space (OS), Residential Single-Family (RSF), Residential Multi-Family (RMF), or Residential Suburban (RS) land use categories designations.
  - h. Parcels in the Airport Review (AR) Area.
- 4. Other planning area standards. Where Article 9 (Community Planning Standards) or Article 10 (Community Area Standards) apply to a parcel within an RE Combining Designation, the standards of Article 9 and Article 10 shall prevail over the requirements of this Section (22.14.100).
- 5. Other combining designations. Projects located within other combining designations shall meet the required findings and standards for those combining designations, including but not limited to Flood Hazard Area (FH), Historic Site (H), and Sensitive Resource Area (SRA) Combining Designations.
- C. Application content. Applications for proposed SEFs within the RE Combining Designation shall include descriptive and plan information as necessary to determine compliance with the requirements of this Section 22.14.100 (Renewable Energy Area) and an application form and other information prepared as specified in Sections 22.60.040.B, 22.60.040.D, and 22.62.040 for Site Plan Review. As noted in Section 22.60.040E, the Director may waive some or all application content requirements at the written request of the applicant if it is demonstrated that the absence of the documentation will not reduce the ability of the

- Director to evaluate the compliance of the proposed project with the standards of this Title. Proposed SEFs eligible for Zoning Clearance as determined by part E of this Section shall submit application and information required by Sections 22.60.040B and 22.62.030.
- D. General requirements. The applicable standards for renewable energy technologies described in Chapter 22.32 (Energy-Generating Facilities) shall apply to all renewable energy facilities proposed within the RE Combining Designation. When standards of Chapter 22.32 conflict with this Section, the standards of this Section shall prevail.
- E. Permit requirements. A proposed roof or structure-mounted SEF within the RE Combining Designation may be eligible for Zoning Clearance as described in Subsection 1. If a ground-mounted SEF is proposed within the RE Combining Designation and meets the criteria of this Section, the project may be eligible for Site Plan Review as described in Subsections 2–41-3. If an SEF is proposed within the RE Combining Designation but does not meet the criteria of this Section, the project is subject to the permit requirements and standards of Chapter 22.32 (Energy-Generating Facilities).
  - 1. Tier 1 SEF. A proposed SEF that is no more than 20 acres, or that is roof- or structure-mounted, is allowable within and outside the RE Combining Designation subject to Zoning Clearance or Site Plan Review, as established in Chapter 22.32 (Energy-Generating Facilities). No additional streamlining or standards for Tier 1 SEFs are provided in this Section (22.14.100). Tier 1 SEF, Roof- or Structure- Mounted. A proposed SEF that is located on the roof or structure of a use that is conforming per Chapter 22.72 of this Title is allowable with Zoning Clearance in accordance with Chapter 22.32.
  - 2. Tier 1 SEF, Ground-Mounted. A proposed SEF that is ground-mounted, no more than 20 acres in total area within the RE Combining Designation, and complies with all development standards of Subsection F of this Section is allowable with Site Plan Review. The proposed SEF shall also meet one of the following criteria:
    - a. <u>Is proposed on land that is graded, disturbed, or altered; consistent with definitions</u>
       for "Development," "Grading," or "Site Disturbance" in this Title, or
    - Is located on land that was previously developed for industrial or commercial purposes and degraded or contaminated and then abandoned or underused.
      - If a proposed project is ground-mounted and 20 acres or less in size but does not meet the criteria for a Tier 1 SEF in Chapter 22.32 SubsectionSubsection 2, the project may be eligible for Site Plan Review as a Tier 2 or Tier 3 SEF within the RE Combining Designation, as described below in Subsections 32-4. If a project is proposed within the RE Combining Designation but does not meet the criteria for Tier 2 or Tier 3 SEFs as outlined in this Section (22.14.100), the permit requirements and standards of Chapter 22.32 (Energy-Generating Facilities) apply.

- 3.2. Tier 2 SEF. If a proposed SEF meets the following criteria and is 40 acres or less in total area of the facility within the RE Combining Designation, the project may be considered a Tier 2 SEF eligible for Site Plan Review. Proposed SEFs that are 40 acres or less in size that do not meet the criteria for a Tier 2 SEF described in Subsections a—ec may be determined to be a Tier 3 SEF based on the criteria of Subsection 4 below. To be eligible for Site Plan Review within the RE Combining Designation as a Tier 2 SEF, a proposed project must be consistent with the following criteria:
  - a. Total area of the proposed SEF is no more than 40 acres in area, measured as the total area of the facility inclusive of components and subsystems that, in combination, convert or store solar energy into electric energy suitable for use.
  - b-a. a-Is proposed on a parcel included in any land use category (vacant or not), except for Open Space (OS), or Recreation (REC), Residential Single-Family (RSF), Residential Multi-Family (RMF), or Residential Suburban (RS).
  - b. B. In the Agriculture (AG) land use category, is not sited on any type of Important Agricultural Soils as defined in the Conservation and Open Space Element, unless sited on Important Agricultural Soils that are designated as solely Highly Productive Rangeland Soils by the Conservation and Open Space Element. The proposed project may be located on solely Highly Productive Rangeland Soils or sited on other areas of the parcel without any Important Agricultural Soils.
  - c. Complies with all development standards of Subsection F of this Section.

If a proposed project is 40 acres or less in size within the RE Combining Designation but does not meet the criteria in Subsection 2, the project may be eligible for Site Plan Review as a Tier 3 SEF within the RE Combining Designation, as described below in Subsection 3. If a project is proposed within the RE Combining Designation but does not meet the criteria for Tier 2 or Tier 3 SEFs as outlined in this Section (22.14.100), the permit requirements and standards of Chapter 22.32 apply and no alternative requirements are available within the RE Combining Designation.

4.3. Tier 3 SEF. If a proposed SEF meets the following criteria and is 160 acres or less within the RE Combining Designation, the project may be considered a Tier 3 SEF eligible for Site Plan Review. To be eligible for Site Plan Review within the RE Combining Designation, a proposed project must be consistent with the following criteria:

Total area of the proposed SEF is no more than 160 acres in area, measured as the total area of the facility inclusive of components and subsystems that, in combination, convert or store solar energy into electric energy suitable for use.

a. <u>Is proposed on a parcel included in the Commercial Service (CS), Industrial (IND), or Agriculture (AG) land use categories (vacant or non-vacant).</u>

- b. In the Agriculture land use category, is not sited on any type of Important

  Agricultural Soils as defined in the Conservation and Open Space Element, unless
  sited on Important Agricultural Soils that are designated as solely Highly Productive

  Rangeland Soils by the Conservation and Open Space Element. The proposed
  project may be located on solely Highly Productive Rangeland Soils or sited on other
  areas of the parcel without any Important Agricultural Soils.
- c. Complies with all development standards of Subsection F of this Section.

If a proposed project is 160 acres or less in size within the RE Combining Designation but does not meet the criteria in Subsection 34 of this Section, the permit requirements and standards of Chapter 22.32 apply and no alternative requirements are available within the RE Combining Designation.

- 5.4. Tier 4 SEF. A solar electric facility that is greater than 160 acres is considered a Tier 4 SEF and shall require a Conditional Use Permit, as identified by Chapter 22.32 (Energy-Generating Facilities). No alternative requirements or streamlining for Tier 4 SEFs apply within the RE Combining Designation.
- F. Development standards. In addition to applicable site criteria in Subsections E(2) E(4), proposed ground-mounted Tier 2 and Tier 3 SEFs within the RE Combining Designation eligible for Site Plan Review shall comply with all standards in Section 22.32.040.A, 22.32.040.C, 22.32.040.D, and 22.32.050.B-D of this Title, in addition to the following, as applicableshall comply with all standards in Section 22.32.040 of this Title and the following, as applicable:
  - Requirements of this section do not preclude authorities and requirements of other local, state, and federal agencies, including but not limited to the San Luis Obispo County Air Pollution Control District, California Department of Fish and Wildlife, California Department of Transportation, United States Fish and Wildlife Service, and the United States Army Corps of Engineers.
  - 2. If Botanical Reports or Biological Reports prepared as part of the proposed SEF permit application indicate the presence or potential presence of state or federally listed wildlife or plant species or designated critical habitat, the permit requirements and standards of Chapter 22.32 (Energy-Generating Facilities) apply and no alternative requirements are available within the RE Combining Designation. Exceptions to this requirement may apply to ground-mounted SEFs less than 40 acres in total project area if the proposed project is located in the San Joaquin Kit Fox Habitat Area and meets the following criteria
    - a. Botanical Reports or Biological Reports do not indicate the presence of additional state or federally listed wildlife or plant species or designated critical habitat on or adjacent to the project site.

- b. The project site of the proposed SEF is less than 40 acres in area, measured as total project site inclusive of total site disturbance. For all other purposes of determining consistency with standards of this Section (22.14.100), the area of the SEF shall be calculated as otherwise directed by Subsection 22.14.100.B1.
- c. The project complies with the standard mitigation ratio and all applicable kit fox conditions for grading and building plans set forth by the Director.

## 2. Tier 2 less than 40 acrescomply

- 3. Ground-mounted SEFs that propose fencing where sensitive wildlife is present shall include wildlife-friendly fencing that is no higher than 48 inches and allows for the free movement of species.
- 4. Ground-mounted SEFs proposed on remediated brownfield sites (areas that have been developed for industrial or commercial purposes, polluted, and then abandoned or underused before remediation); or SEFs proposed on disturbed areas with site disturbance such as grading, paving, development, or other improvements shall meet the following:
  - a. The Site Plan Review application shall include a Habitat Assessment prepared by a qualified biologist.
  - b. Provide setbacks from any special-status plant species and habitat that could support special-status plant or wildlife species as specified in the Habitat Assessment for the proposed project, including federally and state-listed Threatened and Endangered, Candidate, and Rare Species; California Species of Special Concern; California Fully Protected Species; and California Rare Plant Rank 1B and 2 plants.
- 5. Ground-mounted SEFs shall be set back a minimum of 500 feet from any of the following identified on the site, if identified in the Biological Report, required by Section 22.60.040 of this Title:
  - a. Sensitive vegetation and habitat that could support special-status species.
  - b. Special-status species that could occur on the site or adjacent properties.
- 6. Ground-mounted SEFs shall be set back a minimum of 50 feet from any seasonal or perennial wetlands, drainages, vernal pools, or any other potentially jurisdictional features.
- 7. Ground-mounted SEFs shall provide a Archeological Report to demonstrate avoidance of any historical resources or unique archeological resources. The Archeological Report shall include the following information:
  - a. <u>California Historic Resource Information Center (CHRIS) search to identify</u> previous projects and previous resources identified in the project.

- b. Archival map research to identify overall sensitivity for historic-era resources as well as -locations of built resources of at least 45 years of age.
- c. Where these studies identify any potential resources on the proposed project site, the applicant shall also submit the following:
  - (1) One hundred percent (100%) field survey of the proposed project area where all identified resources are recorded on forms required by the State Historic Preservation Officer (SHPO).
  - (2) <u>Correspondence with Native American contacts provided by the Native American Heritage Commission (NAHC) and a search of the sacred lands database maintained by the NAHC to identify sensitive resources.</u>
  - (3) A technical report presenting the results of these studies, the identification of any resources that might be historic resources, and management and treatment recommendations for these resources in a report format meeting SHPO guidelines to identify measures the project would employ to avoid direct or indirect impacts to any potential resources.
- 8. Ground-mounted SEFs proposed on undisturbed areas with no development or site improvements shall provide revegetation for any vegetation to be removed, as follows:
  - a. Provide a minimum 3:1 offset ratio for vegetation to be removed and that is identified as sensitive by the California Department of Fish and Wildlife, including but not limited to riparian vegetation.
  - b. Provide a minimum 1:1 offset ratio for any other vegetation to be removed that is identified by the Biological Report required in Section 22.60.040 as in Subsection 5 above (sensitive vegetation and habitat that could support special-status species on the site or adjacent properties).
  - c. When landscaping is required, it shall include drought-tolerant, non-invasive species to avoid or minimize watering requirements, be compatible with the surrounding native vegetation, and include at least 80 percent native species.
- 9. In the Agriculture (AG) land use category, SEFs proposed on active agricultural uses or SEFs proposed on Highly Productive Rangeland, as defined in the Conservation and Open Space Element, shall meet the following:
  - a. For projects proposed on land in an active agricultural use, the project shall provide a conservation easement as follows in consultation with the Agriculture Department, which shall be on land that supports grazing or uses similar to those within the project site that would be lost due to the proposed project:

- (1) A conservation easement located within San Luis Obispo County at a 1:1 ratio on land that can support agricultural uses at the same intensity as the affected agricultural uses at the proposed project site, or
- (2) A conservation easement located within San Luis Obispo County at a 3:1 ratio on land that can support agricultural uses at a lowerthe same intensity than as the affected agricultural uses on a parcel other than at the proposed project site.
- b. SEFs proposed on Highly Productive Rangeland should be sited to minimize impacts to Important Agricultural Soils to the maximum extent feasible, in consultation with the Agriculture Department. Where that is not feasible, SEFs proposed on Highly Productive Rangeland Soils shall provide the following:
  - (1) A conservation easement located within San Luis Obispo County at a 1:1 ratio on Highly Productive Rangeland Soils or other Important Agriculture

    Agricultural Soils of comparable suitability for agricultural production at the proposed project site, or
  - (2) A conservation easement located within San Luis Obispo County at a 3:1 ratio on Highly Productive Rangeland Soils or other Important Agriculture Agricultural Soils of comparable suitability for agricultural production on a parcel other than the proposed project site.
- c. To determine the suitability of proposed easement sites for purposes of addressing the conversion of agricultural uses or Highly Productive Rangeland, the Agriculture Department shall evaluate criteria related to the intensity and suitability of the site for agriculture, including but not limited to soil capability, available water supply, existing on-site land uses, parcel size, and land use designation.
- e.d. If a proposed SEF demonstrates dual-use design measures that ensure the long-term productivity of agricultural uses on site, or protects agricultural uses or Highly Productive Rangeland Soils through other means, the SEF is allowable without a conservation easement through a Minor Use Permit in consultation with the Agriculture Department. Techniques to allow for continuation of agriculture uses (dual-use) or protection of Highly Productive Rangeland Soils may vary based on underlying parcel and site characteristics, but can be achieved through multiple design features. Examples include, but are not limited to:
  - (1) The installation of SEFs on poles with no disturbance to soils or crops,
  - (2) Elimination of concrete bases, or
  - (3) Mounting panels off the ground using other technologies while continuing agricultural uses or protecting soils underneath.

10. Proposed SEFs shall be sited to be screened from residences and roadways to the maximum extent feasible using existing site features such as natural topography, vegetation, and structures. Where a proposed project cannot be screened using existing features, the project shall provide additional landscaping, screening, or wildlife-friendly fencing where the project abuts public roads.

<u>SECTION 11</u>: Section 22.14.100 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended by renumbering the existing content to read as follows:

## 22.14.100110 - Sensitive Resource Area (SRA)

<u>SECTION 12</u>: Section 22.14.110 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended by renumbering the existing content to read as follows:

## 22.14.110120 - Transfer of Development Credit Sending Site (TDCS)

<u>SECTION 13</u>: Section 22.14.120 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended by renumbering the existing content to read as follows:

## 22.14.120130 - Transfer of Development Credit Receiving Site (TDCR)

SECTION 14: Section 22.22.140.F.1 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

1. Open space parcel required. A cluster division shall include at least one open space parcel. For land use categories other than Residential Single-Family and Multi-Family, such parcel may be used for one of the allowable residential units, provided that the building site does not exceed 6,000 square feet and is defined on the recorded map. Otherwise, the open space parcel shall not be developed with structural uses except as follows: (1) in the Rural Lands, Residential Rural, and Residential Suburban land use categories: agriculture accessory buildings; (2) in the Recreation, Residential Single-Family, and Residential Multi-Family land use categories: community buildings, community residential accessory structures, parking structures, parking spaces, and driveways. The open space parcel in all land use categories may be used for any of the following: Crop production or rangeland; historic, archaeological, or wildlife preserves; water storage or recharge; leach field or spray disposal area; scenic areas; protection from hazardous areas; public outdoor recreation; or other similar open space use; or renewable energy facilities generating energy for on-site use subject to the requirements in Chapter 22.32 (Energy-Generating Facilities), not to exceed 3 acres 25 percent of the area of the open space parcel.

SECTION 15: Section 22.22.150.B.8.c of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

c. Structural uses allowed in defined open space areas. The area proposed for agricultural land and/or open space preservation is not to be developed with structural uses other than:

- (1) A ranch/farm headquarters including up to two of the residential units allowed pursuant to Subsection B9, residential accessory structures and farm support housing, which may be approved or modified after the initial Conditional Use Permit approval through Minor Use Permit, provided that the building site does not exceed 2.5 acres.
- (2) Areas set aside for the preservation of historic buildings identified by the Land Use Element, to be delineated on the recorded map.
- (3) Agricultural accessory structures or agricultural processing uses essential to the continuing agricultural production of food and fiber in the immediately surrounding area, or renewable energy facilities generating energy for on-site use, which may be approved or modified after the initial Conditional Use Permit approval through Minor Use Permit approval, which shall not occupy an aggregate area of the site larger than five 5 acres.
- (4) Renewable energy facilities generating energy for on-site use may be allowed on up to 3 acres25-percent of the open space area subject to the requirements in Chapter 22.32 (Energy-Generating Facilities).

SECTION 16: Chapter 22.32 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

## Chapter 22.32 - Electric Energy-Generating Facilities

<u>SECTION 17</u>: Section 22.32.010 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

22.32.010 – Purpose

This Chapter provides standards to regulate and mitigate the potential adverse effects of various types of electric generating plants energy-generating facilities.

SECTION 18: Section 22.32.020 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

22.32.020 – Applicability

The land use permit requirements of this Chapter apply to the new construction of energy-generating facilities land uses.

## A. Exemptions.

1. Previously permitted projects. Energy-generating facilities approved prior to the effective date of this Section shall not be required to meet the requirements of this Chapter, except that physical modification or alteration to an existing energy-generating facility that materially alters the size, type, or electrical components of the facility which are directly engaged in the production of

energy or storage of energy shall be subject to this Section. Only the modification or alteration shall be subject to this Section as follows:

- a. <u>Staff determinations of substantial conformance with the original permit do not require the issuance of new permits.</u>
- b. Routine operation, maintenance, or in-kind replacements do not require the issuance of new permits.
- 2. Accessory renewable energy-generating facilities.
  - a. An accessory renewable energy-generating facility (see definition in Chapter 22.80) that is ground-mounted and provides energy for on-site uses shall be subject to the permit requirements of this chapter only when does not require a land use permit unless the facility meets one or more of the criteria listed in Subsection b. If proposed Applications for accessory renewable energy-generating facilities do not meet the criteria in Subsection b and shall demonstrate compliance with all applicable standards for the proposed energy-generating facility provided in this Chapter and any other applicable provisions of this Title, the project shall require Zoning Clearance.
  - b. An accessory renewable energy-generating facility shall require a land use permit (other than a Zoning Clearance) as established by Section 22.32.030 of this Chapter if the facility meets one or more of the following criteria:
    - (1) Provides energy for sale to off-site uses.
    - (2) <u>Is within an area designated Open Space (OS) or Recreation</u> (REC).
    - (3) <u>Is within an Airport Review</u>, a Flood Hazard, or Sensitive Resource Area Combining Designation.
    - (4) Is a ground-mounted facility that is greater than 21,780 square feet3 acres in area-(exclusive of the total parcel area).
    - (4)(5) Is a rooftop wind energy conversion system (WECS)
    - (5)(6) Is located within 100 feet of any adjacent property or public road.
    - (7) Is proposed on a parcel with no existing or apparent use or development on the property.

- (6) (8) Is not consistent with definitions for "Use, Accessory" in this Title and accessory to active, on-site uses.
- (7) Is sited on Class I or II soils.
- (9) Is subject to environmentally related permits.
- B. Other area standards. Where a parcel is subject to standards for combining designations in Chapter 22.14, or the standards in Article 9 (Planning Area Standards) or Article 10 (Community Planning Standards), the standards of those sections shall prevail over the requirements of this Chapter (22.32, Energy-Generating Facilities), except for accessory energy-generating facilities within the Airport Review (AR) Area consistent with the criteria in Subsection 22.32.020.A.2.

<u>SECTION 19</u>: Section 22.32.030 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

<del>22.32.020\_22.32.030</del>– <del>Development Standards</del> <u>Permit and Application Requirements</u>

The following permit and application requirements apply to all energy generating facilities, except where other provisions of this Chapter establish different requirements.

- A. Permit requirements. Except where county land use permit authority is preempted by state law, and except where other provisions of this Chapter establish a different permit requirement, the required land use permit <u>for energy-generating facilities</u> is determined as described below.
  - by Non-renewable energy-generating facilities. Permit requirement is determined by the area in square feet per site of grading or the removal of natural ground cover as follows.

## PERMIT REQUIREMENTS FOR NON-RENEWABLE ENERGY-GENERATING FACILITIES

Permit Requirement	Area of Site Disturbance					
Zoning Clearance	Less than 40,000 sf					
Minor Use Permit	40,000 sf or more					

## 2. Energy storage.

- a. <u>Energy storage shall require a Conditional Use Permit where it meets</u> any of the following criteria:
  - (1) It is the primary use of the site.

- (2) It is proposed on a site with no existing or apparent use or development.
- b. Energy storage that is accessory to a primary use shall be subject to the permit requirements and development standards of the primary use.

## 3. Renewable energy facilities.

- a. Permit requirements for SEFs within the Renewable Energy (RE) Combining Designation seeking Site Plan Review are established in Section 22.14.100 (Renewable Energy Area).
- b. Permit requirements for renewable energy facilities, including but not limited to SEF outside of the RE Combining Designation, are determined based on land use and land use category:

# ALLOWABLE LAND USES AND PERMIT REQUIREMENTS FOR RENEWABLE ENERGY FACILITIES BY LAND USE CATEGORY

Tier 3 WECS: greater than 100 feet tall or with a rated capacity of 2 MW or more for all turbines.	CUP(7)	CUP					Refer to 22.32.030 and 22.32.060.

#### <u>Notes</u>

- (1) See Article 8 and this Chapter for definitions of the listed land uses.
- (2) See Article 9 for any restrictions or special permit requirements for a listed use in specific community or area.
- (3) L.U.C. means "land use category." See Section 22.04.020, Table 2-1, for a key to the land use category abbreviations.
- (84) Land uses on property under Land Conservation Act contracts must adhere to the County's Rules of Procedure to Implement The California Land Conservation Act of 1965 (Table 2), individual Contracts, the provisions of the Land Conservation Act itself and any changes that may be made to it.
- (5) The size of the SEF shall be measured as the total area of the facility, inclusive of components and subsystems that, in combination, convert or store solar energy into electric energy suitable for use.
- (6) For Tier 1 SEF projects proposed on land under Land Conservation Act contract up to 20 acres in size, the permit requirements of this Chapter shall apply. Tier 1 SEFs shall comply with the County's Rules of Procedure to Implement The California Land Conservation Act of 1965 (Table 2), individual Contracts, the provisions of the Land Conservation Act itself and any changes that may be made to it.
- (7) For Tier 2 Tier 4 projects proposed on land under Land Conservation Act contract:

1. Proposed projects up to 20 acres in size may be reviewed by Department of Planning and Building staff for consistency with the Rules of Procedure and the Principles of Compatibility unless a discretionary use permit is required by Title 22, in which case the REF project shall be presented to the Agricultural Preserve Review Committee for a recommendation to the Review Authority. The

Agricultural Preserve Review Committee shall base their review on the criteria in the Rules of Procedure and the Principles of Compatibility.

2. Proposed projects -greater than 20 acres shall requires, a Minor Use Permit or Conditional Use Permit as required by this Section, shall be required and the project shall comply with the County's Rules of Procedure to Implement The California Land Conservation Act of 1965 (Table 2), individual Contracts, the provisions of the Land Conservation Act itself and any changes that may be made to it. For purposes of determining permit requirements for WECS proposed on land under Land Conservation Act contract, the area shall be measured as the total area of site disturbance.

(8) Tier 2 – Tier 3 SEFs are allowable up to 20 acres in size when proposed on parcels in the Residential, Single-Family (RSF); Residential, Multi-Family (RMF); or Residential, Suburban (RS) land use designations.

<u>(9)(8)</u> For projects proposed in the Renewable Energy Combining Designation, if the project is consistent with criteria of the RE Combining Designation, alternative permit requirements may apply. Refer to Section 22.14.100 (Renewable Energy Area).

(10) Solar heating and hot water systems are separately defined in Article 8, and are generally allowable as accessory energy-generating facilities, consistent with the criteria of this Chapter.

#### **Notes**

- (1) See Article 8 and this Chapter for definitions of the listed land uses.
- (2) See Article 9 for any restrictions or special permit requirements for a listed use in a specific community or area.
- (3) L.U.C. means "land use category." See Section 22.04.020, Table 2-1, for a key to the land use category abbreviations.
- (4) The size of the SEF shall be measured as the total area of the facility, inclusive of components and subsystems that, in combination, convert or store solar energy into electric energy suitable for use.
- (5) For Tier 1 SEF projects proposed on land under Land Conservation Act contract up to 20 acres in size, the permit requirements of this Chapter shall apply. Tier 1 SEFs shall comply with the County's Rules of Procedure to

<del>Implement The California Land Conservation Act of 1965 (Table 2), individual Contracts, the provisions of the Land</del> <del>Conservation Act itself and any changes that may be made to it.</del>

(6) For projects proposed on land under Land Conservation Act contract greater than 20 acres, a Minor Use Permit shall be required and the project shall comply with the County's Rules of Procedure to Implement The California Land Conservation Act of 1965 (Table 2), individual Contracts, the provisions of the Land Conservation Act itself and any changes that may be made to it. For purposes of determining permit requirements for WECS proposed on and under Land Conservation Act contract, the area shall be measured as the total area of site disturbance or grading.

(75) For projects proposed in the Renewable Energy Combining Designation, if the project is consistent with criteria of the RE Combining Designation, alternative permit requirements may apply. Refer to Section 22.14.100 (Renewable Energy Area).

(6) Solar heating and hot water systems are separately defined in Article 8, and are generally allowable as accessory energy-generating facilities, consistent with the criteria of this Chapter.

## **Key To Permit Requirements**

Symbol	Permit Requirement
<u>A2</u>	Allowable use, subject to the land use permit required by the specific use standards.
<u>P</u>	Permitted use, Zoning Clearance required.
<u>SP</u>	Permitted use, Site Plan Review required.
<u>MUP</u>	Conditional use, Minor Use Permit required.
<u>CUP</u>	Conditional use, Conditional Use Permit required.
	Use not allowed.

- 4. Permit requirements for all other energy-generating facilities not identified in this Section are determined by Chapter 22.06.
- B. Application contents. In addition to any specific requirements later in this Section, land use permit applications shall comply with the requirements of Chapter 22.62 (Permit Applications) and shall also describe:
  - 1. The physical and operating characteristics of the facility; the proposed design capacity of the facility; the operating schedule; how the electric energy shall be used for on-site purposes or for off-site distribution; and if any electric energy shall leave the site, the physical and contractual arrangement for tying-in, or connecting, to other facilities.;
  - 2. For discretionary projects, alternatives Alternatives to the proposed facility and to distinct or separable aspects of the proposal. This will include reliability, as well as economic and environmental advantages and disadvantages.
  - 3. Plans for any overhead or underground transmission lines, transformers, inverters, switchyards, or any required new or upgraded off-site transmission facilities.; and

- 4. For energy-generating facilities that require a Site Plan Review, an application form and other information prepared as specified in Section 22.60.040 B, 22.60.040 D, and 22.62.040 for Site Plan Review. As noted in Section 22.60.040 E, the Director may waive some or all application content requirements at the written request of the applicant if it is demonstrated that the absence of the documentation will not reduce the ability of the Director to evaluate the compliance of the proposed project with the standards of this Title.
- 5. For energy-generating facilities eligible for Zoning Clearance as determined by Section 22.32.030 of this Chapter, an application form and information required by Section 22.60.040B and 22.62.030 of this Title.
- 6. For Tier 4 SEFs and discretionary non-renewable energy-generating facilities, 4. <u>t</u>The number and characterization by trades of the estimated construction and operation force. If construction is estimated to take over six months, the construction workforce will be estimated for each six-month period and will include estimates of numbers of locally hired employees and employees who will move into the area, and a discussion of the estimated impact that employees moving into the area will have on housing, schools, and traffic.
- 7. Proposed energy-generating facilities that require a discretionary permit that are located in the Camp Roberts Study Area (see Figure) shall be referred by the County to Camp Roberts for review and comment.

## **CAMP ROBERTS STUDY AREA**

## [PLACEHOLDER]

- C. Approvals from other agencies. If another public agency must approve the proposed facility, the applicant shall:
  - Describe the requirements of that agency; summarize the agency's procedures for acting on the proposed use, and describe the studies, analyses, and other data collection which the applicant or agency will perform in order to resolve each substantive requirement of the agency.
  - 2. List the required actions related to the proposed facility by other public agencies and utilities and a schedule for application and approval of those actions.
  - 3. Provide a copy of necessary state and federal permits and all written comments and decisions made by officials of the agencies listed prior to the start of construction.
- D. Information from other applications. An applicant may incorporate by reference any information developed or submitted in any other application for the project, provided the applicant submits a copy or summary of the referenced material, identifies the permitting

process in which it was submitted and the outcome of that permitting process, and explains the relevance of the information to the approval standards of this Title.

<u>SECTION 20</u>: Section 22.32.030 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

22.32.030 22.32.040 - Development Standards and General Requirements

The following development standards are applicable to all types of energy-generating facilities allowable by this Title, as identified below. Note that general standards are not exclusive. Projects may be subject to multiple types of standards from Subsections A-C.

- A. General standards applicable to all energy-generating facilities.
  - 1. Decommissioning and restoration. A decommissioning and restoration plan shall be submitted that includes the removal of all facility elements and reclamation of the site. Plans shall address: removal of all facility elements and reclamation of the site including but not limited to evaluation of adjacent grasses and vegetation, soil preparation, seed/crop planting, and watering and fertilization (if necessary). Removal and restoration shall also address all facility elements, including but not limited to solar modules, trackers, tracking, posts, power station electrical equipment, underground conduits and cables, concrete pads, fences, security lighting, and access road gravels.

A. Bonding. Following permit approval and prior to any work on the proposed site, the applicant shall post a surety bond in favor of the County, conditioned on conformance with all applicable conditions, restrictions, and requirements of this Title and any conditions required by the permit. Such guarantee is in addition to any bond required by the state. The total value of this bond will be established through the Conditional Use Permit review and approval process, and will be administered in compliance with Section 22.64.040. Bonding for decommissioning energy generating facilities. Prior to acceptance of a discretionary permit application for an energy-generating facility, the applicant shall submit a cost estimate of the decommissioning work for review by the County or qualified third-party consultant approved by the County. A bond shall be posted in the amount identified in the cost estimate prior to issuance of any construction permits.

B. Environmental quality assurance. An Environmental Quality Assurance Program covering all aspects of construction and operation shall be submitted prior to construction of any project component. This program will include a schedule and plan for monitoring and demonstrating compliance with all requirements of the Conditional Use Permit. Specific requirements of this Environmental Quality Assurance Program will be determined during the environmental review process and Conditional Use Permit review and approval process.

- 2. C. Clearing and revegetation. The land area exposed and the vegetation removed during construction shall be the minimum necessary to install and operate the facility. Topsoil must be stripped and stored separately. Disturbed areas no longer required for operation will be regraded, covered with topsoil, and replanted during the next appropriate season.
- 3. D. Utility interconnect. All distribution lines, electrical substations, and other interconnection facilities shall be constructed to the specifications of the utility. A statement from the utility confirming that the proposed interconnection is acceptable shall be filed with the County building inspector prior to the issuance of any building permit. Interconnection shall conform to procedures and standards established by the California Public Utilities Commission.
  - E. Other requirements. Development standards in addition to those specified in this Section and in this Chapter may be imposed through conditions of approval where Minor Use Permit or Conditional Use Permit approval is required.
- 4. <u>Undergrounding of electrical equipment</u>. All electric distribution lines of low to medium voltage less than 60 kV shall be located underground up to the low-voltage side of the step-up transformer, to the point of on-site use, or to the utility-interface point of an on-site substation.
- 5. Safety signage. The project shall include electrical safety signage on all arrays in the immediate vicinity of all wiring and all electrical conduits to reduce the risk of electrical shock and fire. All signage shall use weather-resistant and fade-proof materials to provide reasonable notice to protect employees and visitors.
- 6. Easements. Any application for a renewable energy facility or distribution lines requiring easements across parcels other than those under the control of the project applicant, or involving multiple parcels, shall provide evidence of necessary easements prior to the issuance of a building permit. The applicant shall also provide evidence of adequate noticing for all impacted landowners and regulatory agencies
- B. Bonding. The permit application for any energy-generating facility except for Tier 1 SEF, Tier 1 WECS, and accessory energy-generating facilities shall include a cost estimate of the decommissioning work with the decommissioning and restoration plan required by Subsection 22.32.040.A, for review by the County or qualified third-party consultant approved by the County. A bond shall be posted in the amount identified in the cost estimate prior to issuance of any construction permits.
- B.C. Standards applicable to energy-generating facilities requiring a discretionary permit.
  - 1. Environmental quality assurance. Projects that require a discretionary permit per this Section Chapter shall submit an Environmental Quality Assurance Program covering all aspects of construction and operation prior to construction of any

project component. This program will include a schedule and plan for monitoring and demonstrating compliance with all requirements of the land use permit. Specific requirements of this Environmental Quality Assurance Program will be determined during the environmental review process and land use permit review and approval process.

- 2. Bonding for decommissioning. Energy-generating facilities requiring a discretionary permit per this Section shall submit a decommissioning report for review and approval with a cost estimate of the decommissioning work for review by the County or qualified third-party consultant approved by the County. A bond shall be posted in the amount identified in the cost estimate prior to issuance of any construction permits.
- Standards applicable to energy-generating facilities requiring a discretionary permit
  that are ground-mounted (including renewable and non-renewable energy-generating
  facilities).
  - a. Decommissioning and restoration. Proposed energy generating facilities that are ground-mounted shall submit a decommissioning and restoration plan for the facility that includes the removal of all facility elements and reclamation of the site. Plans shall address: removal of all facility elements, including but not limited to solar modules, trackers, tracking, posts, power station electrical equipment, underground conduits and cables, concrete pads, fences, security lighting, and access road gravels and reclamation of the site including but not limited to evaluation of adjacent grasses and vegetation, soil preparation, seed/crop planting, and watering and fertilization (if necessary).
- 4.2. Standards applicable to renewable energy facilities requiring a discretionary permit.
  - a. Recycling and disposal plan for renewable energy facilities. Projects subject to a discretionary permit per this Section shall submit a recycling and disposal plan for renewable energy infrastructure, including photovoltaic panels, in order that project structures not pose a risk to human health or the environment. The recycling and disposal plan should include panels that are broken during all project phases, including transport, installation, operation, and after project decommissioning. The plan shall specify how these project components will be disposed of in a manner that will not pose a risk to human health or the environment, and the costs of such disposal.
- C.D. Standards applicable to all ground-mounted energy-generating facilities—that are ground-mounted.
  - 1. Requirements of this section do not preclude authorities and requirements of other local, state, and federal agencies, including but not limited to the San Luis Obispo

- County Air Pollution Control District, California Department of Fish and Wildlife, California Department of Transportation, United States Fish and Wildlife Service, and the United States Army Corps of Engineers.
- 2. Proposed ground-mounted energy-generating facilities otherwise eligible for a Site Plan Review shall be subject to a Minor Use Permit, unless this Chapter (22.32, Energy-Generating Facilities) otherwise requires a Conditional Use Permit, if Botanical Reports or Biological Reports prepared as part of the permit application indicate the presence or potential presence of state or federally listed wildlife or plant species or designated critical habitat unless the proposed project is located in the San Joaquin Kit Fox Habitat Area and meets the following criteria.

## a. Is ground-mounted;

- b-a. The project site of the proposed energy-generating facility is 4s-20 acres or less; measured as total project site inclusive of total site disturbance. For all other purposes of determining consistency with standards of this Chapter (22.32, Energy-Generating Facilities), the area of the facility shall be calculated as otherwise directed by Subsection 22.32.030;
- e.b. Botanical Reports or Biological Reports do not indicate the presence of additional state or federally listed wildlife or plant species or designated critical habitat on or adjacent to the project site; and
- d.c. The project complies Complies with the standard mitigation ratio and- all applicable San Joaquin Kit Fox Habitat Area conditions for grading and building plans set forth by the Director.
- 3. Abandonment of ground-mounted facilities. When any ground-mounted energy-generating facility ceases to produce energy on a continuous basis for 12 months, it shall be considered abandoned and a public nuisance unless the owner or operator demonstrates by substantial evidence satisfactory to the Director of Planning and Building Department that there is no intent to abandon the facility. Owners or operators are required to remove all equipment and facilities and to restore the site to the original condition upon abandonment. Facilities deemed by the County to be unsafe and facilities erected in violation of this Section shall also be considered abandoned.
  - a. The Code Enforcement Officer or any other employee of the Planning and Building Department shall have the right to request documentation and/or affidavits from the system owner/operator regarding the system's usage and to make a determination as to the date of abandonment or the date on which other violation(s) occurred.
  - b. <u>Upon a determination of abandonment or other violation(s)</u>, the <u>Director of Planning and Building shall send a notice thereof to the owner or operator</u>,

indicating that the responsible party shall remove the energy-generating facility and all associated facilities, and remediate the site to its approximate original condition within 90 days of notice by the Director of Planning and Building, unless the County determines that the facilities must be removed in a shorter period to protect public safety. Alternatively, if the violation(s) can be addressed by means other than removing the energy-generating facility and restoration of the site, the Director may advise the owner or operator of such alternative means of resolving the violation(s).

- c. In the event the responsible parties have failed to comply, the County's Director of Planning and Building or his or her designee may remove the energy-generating facility and restore the site and may thereafter (a) draw funds from any bond, security, or financial assurance that may have been provided, or (b) initiate judicial proceedings or take other steps authorized by law against the responsible parties to recover only those costs associated with the removal of structures deemed a public hazard.
- 4. <u>Standards applicable to ground-mounted renewable energy facilities (including projects requiring a ministerial or discretionary permit).</u>
  - a. <u>Ground-mounted renewable energy facilities shall avoid siting on exposed bedrock, rock outcrops, or significant ridgetops.</u>
  - b. Ground-mounted renewable energy facilities shall provide an Integrated Pest Management Plan to identify measures for weed control. Measures may include, but are not limited to, native ground cover, livestock grazing to control grasses, manual harvest, or vegetative management.
- D.E. Other requirements. Where this Section does not specify development standards for a proposed energy-generating use, the County will establish standards through the required land use permit.

SECTION 21: Section 22.32.050 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended by replacing the existing content in its entirety with new content to read as follows:

## 22.32.050 – Solar Electric Facilities

- A. Permit requirements. Permit requirements by land use category for SEFs are summarized in Section 22.32.030 of this Chapter. Where requirements vary based on the technology and site criteria, requirements shall be as described in Subsections 1–3.
  - 1. <u>Calculation of SEF size</u>. For purposes of this Section, the size of the proposed SEF shall be measured as the total area of the facility inclusive of components and subsystems that, in combination, convert or store solar energy into electric energy suitable for use.

- 2. Applicability of SEF permit requirements. The permit requirements of this Section shall apply only to the proposed SEF, inclusive of components and subsystems that, in combination, convert or store solar energy into electric energy suitable for use. Where other accessory or primary uses are proposed that indirectly support the proposed SEF, the applicable permit requirement for the additional use shall be determined as described in Chapter 22.06 (Allowable Land Uses and Permit Requirements by Land Use Category).
- 3. Applicable permit requirements for SEFs based on site criteria.
  - a. <u>Tier 1 SEF, Roof- or Structure-Mounted. If a proposed SEF located on the roof or structure of a use that is conforming per Chapter 22.72 of this Title, the project shall require Zoning Clearance.</u>
  - b. Tier 1 SEF, Ground-Mounted. If a proposed SEF is 20 acres or less, is not located on Class I or Class II soils, and is located to meet one or more of the site eligibility criteria presented in (12)—(2e) below, the project is considered a Tier 1 SEF and shall require Site Plan Review. Projects seeking Tier 1 site eligibility must meet the following criteria:
    - (1) <u>Is located on land that is graded, disturbed, or altered; consistent with definitions for "Development," "Grading," or "Site Disturbance" in this Title, or </u>
    - (2) Is located on land that was previously developed for industrial or commercial purposes and degraded or contaminated and then abandoned or underused.
    - Proposed SEFs that are 20 acres or less but do not meet the Tier 1 site eligibility criteria may be considered a Tier 2 SEF eligible for a Minor Use Permit when consistent with the standards of Subsection c below.
  - c. Tier 2 SEF. If a proposed SEF is 40 acres or less, is not located on Class I or Class II soils, and is located to meet the site eligibility criteria in (1)–(3) below, the project is considered a Tier 2 SEF and shall require a Minor Use Permit. Proposed projects that are 40 acres or less and located in the Renewable Energy (RE) Combining Designation may be eligible for Site Plan Review when consistent with the site criteria in Section 22.14.100 (Renewable Energy Combining Designation). Projects located outside of the RE Combining Designation seeking Tier 2 site eligibility must meet the following criteria
    - (1) <u>Is not located on Class I or Class II soils, and</u>
    - (2) <u>Is ground-mounted, and</u>

(3) <u>Located in urban areas, or located in rural areas on sites</u> <u>designated as Commercial Service (CS) or Industrial (IND).</u>

Proposed SEFs that are 40 acres or less but do not meet the Tier 2 site eligibility criteria may be considered a Tier 3 SEF allowable with a Conditional Use Permit when consistent with the standards of Subsection ed.

- d. Tier 3 SEF. If a proposed SEF is 160 acres or less, is not located on Class I or Class II soils, and does not meet the criteria for Tier 1 or Tier 2 SEFs described above in Subsections a and b c and is located outside of a Renewable Energy (RE) Combining Designation, the project is considered a Tier 3 SEF and shall require a Conditional Use Permit where allowable in Section 22.32.030table below. Proposed projects that are 160 acres or less and located in the RE Combining Designation may be eligible for Site Plan Review when consistent with the site criteria in Section 22.14.100 (Renewable Energy Combining Designation).
- e. <u>Tier 4 SEF. An SEF that is greater than 160 acres and is not located on Class I or Class II soils is considered a Tier 4 SEF and shall require a Conditional Use Permit where allowable in table below.</u>

## B. Setbacks.

- 1. Roof- or structure-mounted SEFs are subject to the setback areas for the type of structure on which they are mounted as regulated by Section 22.10.140.
- 2. The minimum setbacks for ground-mounted SEFs are determined as follows:

## MINIMUM SETBACKS FOR GROUND-MOUNTED SOLAR ELECTRIC FACILITIES(1)

		<u>Setback</u>							
<u>Land Use</u>	Front	<u>Side</u>	Rear						
Rural Areas									
Tier 1 and Tier 2 SEF <sup>(2)</sup> 40 acres or less	25 feet	10% of lot width to a maximum of 30 feet, but not less than 15 feet, on sites less than 1 acre:  Minimum of 30 feet on sites 1 acre or larger	30 feet						
Tier 3 SEF  160 acres or less	<u>50 feet</u>	30 feet	<u>50 feet</u>						
Tier 4 More than 160 acres	100 feet	100 feet	100 feet						

	<u>Setback</u>					
<u>Land Use</u>	Front	<u>Side</u>	<u>Rear</u>			
Urban and Village A	<u>Areas</u>					
Tier 1 and Tier 2 SEF <sup>(2)</sup> 40 acres or less	15 feet	10% of lot width to a maximum of 20 feet, but not less than 10 feet, on sites less than 1 acre  Minimum of 30 feet on sites of one acre or larger in net area	15 feet			
Tier 3 SEF  160 acres or less	<u>20 feet</u>	20 feet	<u>20 feet</u>			
Tier 4 SEF  More than 160 acres	100 feet	100 feet	<u>100 feet</u>			

#### Notes:

- (1) Proposed SEFs shall also comply with the following minimum setbacks where applicable:
- All SEFs shall be set back a minimum of 100 feet from all adjacent parcels in Open Space and Recreation land use categories.
- All SEFs shall be set back a minimum of 50 feet from any seasonal or perennial wetlands, drainages, and vernal pools, except as follows.
- All SEFs requiring a Site Plan Review or discretionary review shall be set back a minimum of 500 feet from any of the following where it is identified in the biological report:
  - O Sensitive vegetation and habitat that could support special-status plant or wildlife species.
  - O Special-status species that could occur on the site or adjacent properties.
  - O Any seasonal or perennial wetlands, drainages, vernal pools, and any other potentially jurisdictional features where sensitive wildlife is present.
- (2) Tier 1 and Tier 2 solar electric facilities that are 40 acres or less in size shall be set back from all adjacent parcels in a Residential land use category 10 feet more than the minimum setbacks.

## C. Height limits.

- 1. Measurement of height. The height for all SEFs shall be measured as the vertical distance from the highest point of the SEF to the average of the highest and lowest points where the vertical planes of the SEF would touch the roof surface (for roof-mounted SEFs) or the ground (for ground-mounted SEFs).
- 2. <u>Height limits. The maximum heights for ground-mounted and roof-mounted SEFs are provided below, respectively.</u>

## HEIGHT LIMITS FOR GROUND-MOUNTED SOLAR ELECTRIC FACILITIES

	Land Use Category						
	Residential (RR, RS, RSF, RMF), Open	All Other Land Use Categories					
<u>Land Use</u>	Space, Recreation, and Public Facilities						
Tier 1, 2, and 3	15 feet	<u>25 feet</u>					
<u>SEF</u>							
160 acres or less							
Tier 4 SEF	Not applicable	<u>45 feet</u>					
More than 160 acres							

## MAXIMUM HEIGHT LIMITS FOR ROOF-MOUNTED SOLAR ELECTRIC FACILITIES

	Land Use Category							
	Agriculture and Rural Lands	Residential (RR, RS, RSF, RMF)	Commercial and Industrial (OP,	Open Space, Recreation,				
Land Use	(AG, RL)	<del>Roj Roj j Rivil j</del>	CR, CS, IND)	Public Facilities				
All solar electric facilities	No more than 5 feet	No more than 3 feet	No more than 5 feet	No more than 3 feet				

- D. Other special standards for SEFs. In addition to the general standards applicable to all energy-generating facilities, the following standards shall apply to SEFs.
  - 1. All SEFs shall use nonreflective surfaces that minimize glare to the greatest extent feasible.
  - 2. <u>Tier 1 roof- or structure-mounted SEFs shall be integrated with roofing materials and/or blended with a structure's architectural form. Any roof- or structure-mounted SEF and its equipment shall be designed to be removed at a later date for the roof to be returned to its original pre-project condition.</u>
  - 3. Rotating SEFs shall have tracking system design and shall not create concentrated reflections directed at occupied structures, recreation areas, Sensitive Resource Areas, or public roads.
  - 4. Ground-mounted SEFs shall be located a minimum of 18 inches from the ground to allow wildlife movement and line of sight for wildlife.
  - 5. <u>Lighting is required, it shall be activated by motion sensors, fully shielded, and a downcast type so the light does not spill onto adjacent parcels or illuminate the night sky.</u>
  - 6. In the Flood Hazard Combining Designation, solar equipment, wiring, and other supportive electric equipment (such as inverters or transfer switches) shall be located above the base flood elevation.

- 7. SEFs requiring a discretionary permit shall be sited for screening from residences, Sensitive Resources Areas for visual resources, and areas subject to Highway Corridor Design Standards. Screening measures shall use existing site characteristics to the greatest extent feasible, including existing vegetation and natural topography. Where a project cannot be sited to provide adequate screening, the project shall provide additional screening such as landscaping, or wildlife-friendly fencing-shall be provided.
- 8. SEFs shall not be sited on designated Class I or Class II soils. Where proposed on parcels with Class I and Class II soils, the SEF shall be sited on other areas of the parcel.
- 9. SEFs requiring a discretionary permit proposed in the Agriculture (AG) land use category on land in an active agricultural use or on Important Agricultural Soils, as defined in the Conservation and Open Space Element, shall meet the following:
  - a. For projects proposed on land in an active agricultural use, the project shall provide a conservation easement as follows in consultation with the Agriculture Department, which shall be on land that supports grazing or uses similar to those within the project site that would be lost due to the proposed project:
    - (1) A conservation easement located within San Luis Obispo County at a 1:1 ratio on land that can support agricultural uses at the same intensity as the affected agricultural uses at the proposed project site, or
    - (2) A conservation easement located within San Luis Obispo County at a 3:1 ratio on land that can support agricultural uses at a lower the same intensity as than the affected agricultural uses on a parcel other than at the proposed project site.
  - b. For projects proposed on parcels with Important Agriculturale Soils, the project should be sited to minimize impacts to Important Agricultural Soils to the maximum extent feasible, in consultation with the Agriculture Department. Where that is not feasible, projects proposed on Important Agriculturale Soils shall provide the following:
    - (1) A conservation easement located within San Luis Obispo County at a 1:1 ratio on Important Agriculturale Soils of comparable suitability for agricultural production at the proposed project site, or
    - (2) A conservation easement located within San Luis Obispo County at a 3:1 ratio on Highly Productive Rangeland Soils or other Important Agriculturale Soils of comparable suitability for agricultural production on a parcel other than the proposed project site.

- c. To determine the suitability of proposed easement sites for purposes of addressing the conversion of agricultural uses or Highly Productive Rangeland, the Agriculture Department shall evaluate criteria related to the intensity and suitability of the site for agriculture, including but not limited to soil capability, available water supply, existing on-site land uses, parcel size, and land use designation.
- e.d. If a proposed project demonstrates dual-use design measures that ensure the long-term productivity of agricultural uses on site, or protects Important Agricultural Soils through other means, the project is allowable without a conservation easement through a Conditional Use Permit in consultation with the Agriculture Department. Techniques to allow for continuation of agriculture uses (dual-use) or protection of Highly Productive Rangeland Soils may vary based on underlying parcel and site characteristics, but can be achieved through multiple design features. Examples include, but are not limited to:
  - (1) The installation of SEFs on poles with no disturbance to soils or crops:
  - (2) Elimination of concrete bases, or
  - (3) Mounting panels off the ground using other technologies while continuing agricultural uses or protecting soils underneath.

SECTION 22: Section 22.32.060 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended by replacing the existing content in its entirety with new content to read as follows:

Determination of permit requirements for wind energy conversion systems (WECS). Permit requirements for WECS are identified in **Table X** of Section 22.32.030 of this Chapter by land use category. Where allowable, WECS requirements vary based on technology and system type as described in Subsections 1 – 3.

- 1. <u>Tier 1 WECS.</u> A wind energy conversion system that is mounted on a roof or structure of a conforming use per 22.72 of this Title is considered a Tier 1 WECS and shall require a Zoning Clearance where allowable.
- 2. <u>Tier 2 WECS. A wind energy conversion system is considered a Tier 2 WECS and shall require a Minor Use Permit Site Plan Review</u> where allowable if it meets all of the following criteria:
  - a. Is ground-mounted.
  - b. <u>Is no greater than 100 feet tall, as measured from the natural grade below the wind turbine to the uppermost extension of any blades.</u>

- c. Has a cumulative rated capacity of 2 MW or less for all turbines proposed on the site.
- 3. Tier 3 WECS. A wind energy conversion system that is ground-mounted and does not meet the criteria for Tier 2 WECS is considered a Tier 3 solar WECS and shall require a Conditional Use Permit where allowable.

#### B. Setbacks.

1. <u>Tier 1 WECs (roof- or structure-mounted) are subject to the setbacks for the type of structure on which they are mounted as specified in Section 22.10.140.</u>

#### 2. Ground-mounted WECs.

a. The minimum setbacks for ground-mounted WECS are determined by project height, as measured from the lowest point to the highest point of the WECS, as shown below.

## MINIMUM SETBACKS FOR GROUND-MOUNTED WIND ENERGY CONVERSION SYSTEMS<sup>(1)</sup>

	<u>Setback</u>		
<u>Land Use</u>	<u>Front</u>	<u>Side</u>	<u>Rear</u>
Tier 2 WECS	Minimum of two times the overall machine height on sites		
	less than 5 acres		
	Minimum of three times the overall machine height on sites		
	more than 5 acres		
Tier 3 WECS	Minimum of three ti	imes the overall mach	<u>ine height</u>

#### Notes:

- (1) All ground-mounted WECS shall also comply with the following minimum setbacks where applicable:
  - a. 50 feet from any seasonal or perennial wetlands, drainages, and vernal pools.
  - b. 500 feet from any wetlands or riparian zones, or from any location found to serve as a nesting or roosting site for any sensitive bird or bat species or any species of raptor.

#### C. Height limits.

- 1. Measurement of height. The height for all WECS shall be measured as the vertical distance from the lowest point of the WECS to the uppermost extension of any rotor, for both roof-mounted and ground-mounted systems.
- 2. Height limits. The maximum heights for WECS are shown in the table below. For roof- or structure-mounted WECS, these height limits may exceed the maximum height limits for the structure established in Section 22.10.090 (Height Measurement and Height Limit Exceptions).

#### HEIGHT LIMITS FOR WIND ENERGY CONVERSION SYSTEMS(1)

	Land Use Category		
	Agriculture, Rural Lands, and	All Other Land	
Land Use	Public Facilities (AG, RL, PF)	Use Categories	
Tier 1 WECS	<u>10 feet</u>	<u>5 feet</u>	
Tier 2 WECS	<u>100 feet</u>	<u>100 feet</u>	
Tier 3 WECS	<u>600 feet</u>	<u>500 feet</u>	

#### Notes:

(1) All WECS in the Vertical Obstruction Camp Roberts Influence Areas shall not exceed 75 feet in height, as described in Subsection 22.32.060.D of this Chapter:

#### D. Other Special Standards for Wind Energy Conversion Systems

- 1. All ground-mounted WECS shall be sited to maintain natural grades and shall use existing roads for access to the extent possible. Any grading or road construction that is required shall be the minimum necessary to locate the system and establish sufficient access. The land use permit application shall demonstrate that an alternative site on the parcel is less suitable for other reasons.
- 2. <u>Tier 1 roof- or structure-mounted WECS shall be designed to be removed at a later date for the roof to be returned to its original pre-project condition.</u>
- 3. Ground-mounted WECS requiring a discretionary permit shall not be sited on designated Class I or Class II soils. Where proposed on parcels with Class I and Class II soils, the WECS shall be sited on other areas of the parcel.
- 4. A WECS shall not generate noise levels exceeding any standards of the Noise Element of the San Luis Obispo County General Plan. The system shall be designed and constructed in compliance with the California Building Code and the National Electric Code. The safety of the design and construction shall be certified by a California-licensed mechanical, structural, or civil engineer.
- 5. For a WECS with multiple turbines, each turbine shall be separated from all others by a distance at least equal to that of the diameter of the rotors.
- 6. <u>Tier 3 WECS shall be located to minimize visual impacts to residences, Sensitive Resource Areas for visual resources, and areas subject to Highway Corridor Design Standards.</u>
- 7. Ground-mounted WECS within the Vertical Obstruction Camp Roberts Influence Areas (see Figure) shall not exceed 75 feet in height.

**VERTICAL OBSTRUCTION CAMP ROBERTS INFLUENCE AREAS** 

[PLACEHOLDER]

#### 7-8. The design of all WECS shall be as follows:

#### a. be as follows:

- b-a. All materials and surfaces shall be that are nonreflective and of an unobtrusive color.
- e.b. The WECS and individual components shall carry all appropriate warning signs.
- d.c. Guy wires shall be avoided to the extent possible. If they are necessary, all guy wires shall be marked with bird deterrent devices as recommended by the US Fish and Wildlife Service or the California Department of Fish and Wildlife.
- e.d. No exterior lighting shall be allowed except for lighting required by the Federal Aviation Administration, which shall be at the lowest allowable intensity.
- f.e. All turbines shall be equipped with manual and automatic overspeed controls capable of limiting the blade rotation speeds to within the design limits of the system.
- g.f. Ground-mounted WECS shall be designed to prevent climbing within the first 12 feet. Any climbing apparatus shall be located at least 12 feet above the finished grade.
- h.g. No portion of a blade of a ground-mounted WECS shall extend within 20 feet of the finished grade.
- i-h. The lowermost extension of any rotor of a Tier 2 or Tier 3 WECS shall be 30 feet above the highest existing occupied structure or tree within a 250-foot radius. A modification to this standard may be approved by the Review Authority if the applicant demonstrates that a lower height will not jeopardize the safety of the wind turbine structure.

SECTION 23: Section 22.80.030.A on page 8-4 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

Accessory Renewable Energy-Generating Facilities. Ground-mounted Energy-generating facilities accessory to any principal use and customarily a part thereof engaged in the production of energy from sources that regenerate, as defined under "Renewable Energy Facilities." Accessory renewable energy-generating facilities are incidental to the principal use and consistent with the definition for "Use, Accessory" in this Title. The energy produced by accessory renewable energy-generating facilities primarily and generate energy primarily for supports the principal use of the site. Includes roof-mounted energy-generating facilities, which are further

defined under "Energy-Generating Facilities,-" but does not include roof-mounted wind energy conversion systems (WECS).

<u>SECTION 24</u>: Section 22.80.030.A on page 8-5 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

Agricultural Accessory Structure (land use): An uninhabited structures or buildings designed and built to store farm animals, implements, supplies, or products (not including commercial greenhouses which are included under "Nursery Specialties," or buildings for agricultural processing activities) that contains no residential use and is not open to the public. Also include greenhouses engaged in agricultural research as the primary use. Agricultural accessory structures can also include but not be limited to wind- and solar-powered devices used for direct climate control, and water pumping or other conversion of wind, or solar, or bioenergy energy to mechanical, electrical, or thermal power used on-site. Wind energy conversion systems and solar electric facilities machines—for electric power generation are separately defined. Includes barns, grain elevators, silos, and other similar buildings and structures. [Amended 1989, Ord. 2411; 1995, Ord. 2740].

<u>SECTION 25</u>: Section 22.80.030.B on page 8-9 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

Bioenergy Facilities. Facilities engaged in the production of renewable energy from combustion or decomposition of biomass or biogas including forest and other wood waste, agriculture and food processing wastes, organic urban waste, waste and emissions from water treatment facilities, landfill gas, and other organic waste sources. Bioenergy can be used to generate renewable electricity, liquid fuels, and biogas. Primary types of bioenergy are biomass, landfill gas, digester gas, and municipal solid waste. Bioenergy facilities are a type of renewable energy facility and included under "Energy-Generating Facilities" and "Renewable Energy Facilities" as defined by this Title.

SECTION 26: Section 22.80.030.D on page 8-20 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

Distributed Energy Resources (DER). Small, modular, energy generation and accessory storage technologies that provide electric capacity or energy located where it's needed, often at a customer's location or close to a load center. These facilities are typically owned by non-utility entities, such as generation developers or utility customers that offset all or part of the customer's on-site electrical load. DER's typically produce less than 20 megawatts of power near the point of use and include wind turbines, photovoltaics (PV), fuel cells, microturbines, reciprocating engines, combustion turbines, cogeneration, and energy storage systems. DER systems may be either connected to the local electric power grid or isolated from the grid in stand-alone applications. DER systems are a type of energy-generating facility and included under "Energy-Generating Facilities" as defined by this Title.

<u>SECTION 27</u>: Section 22.80.030.E on page 8-23 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

Electric Generating Plants Energy-Generating Facilities (land use). Facilities engaged in the generation and distribution of electrical energy for sale and the accessory energy storage systems to support them. The electricity energy may be generated from oil, gas, coal, or nuclear fuels or from "alternate" sources including but not limited to water, wind, the sun, biogas, or municipal or agricultural wastes. This includes "cogeneration," which means the sequential use of energy for the production of electrical and useful thermal energy. The sequence can be thermal use followed by electric power production or the reverse. See also "Wind Energy Conversion System." Includes, but is not limited to:

- a. Electric-generating plants generating electricity for sale.
- b. Renewable energy facilities producing energy for on- or off-site use such as "Solar Electric Facilities" or "Wind Energy Conversion Facilities" as defined by this Title.
- c. "Non-Renewable Energy Facilities" defined by this Title, such as power plants fueled with natural gas.

Energy Storage. Energy storage technologies store energy and deliver it to the electric grid or an end user at a later time. This includes both small, battery systems and independent, freestanding facilities, such as flow batteries, flywheel devices, compressed air energy storage, or pumped hydro energy storage (PHES) technologies. Accessory energy storage that supports on-site energy production is included separately under the primary on-site energy-generating facility, including "Solar Electric Facilities," "Wind Energy Conversion Facilities," or other types of "Energy-Generating Facilities" as defined by this Title.

SECTION 28: Section 22.80.030.N on page 8-46 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

Non-Renewable Energy Generating Facilities. Facilities that generate or store energy from non-renewable sources such as oil, gas, or coal. Non-renewable energy generating facilities are a type of energy-generating facility and included under "Energy-Generating Facilities" as defined by this Title.

SECTION 29: Section 22.80.030.R on page 8-59 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

Renewable Energy Facilities (REF). Facilities that generate or store energy from sources that regenerate as defined by the California Public Resources Code, including but not limited to energy conversion systems such as bioenergy, solar thermal, photovoltaic, wind, geothermal, fuel cells using renewable fuels, small hydroelectric generation of 30 megawatts or less, digester gas, municipal solid waste conversion, landfill gas, ocean wave, ocean thermal, or tidal current (California Public Resources Code Section 25741.a.1). Renewable energy facilities are a type of energy-generating facility and included under "Energy-Generating Facilities" as defined by this Title. Includes "Bioenergy Facilities," "Solar Electric Facilities," "Solar Heating and Hot Water

Systems," "Solar Thermal Facilities," and "Wind Energy Conversion Systems" as defined by this Title.

<u>SECTION 30</u>: Section 22.80.030.S on page 8-68 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

Solar Electric Facilities (SEF). Any solar electric system including the components and subsystems that, in combination, convert solar energy into electric energy suitable for use. Includes, but is not limited to, photovoltaic systems and the accessory solar energy storage systems to support them. Transmission lines located off the site of the facility are included under "Pipelines and Transmission Lines." Electrical substations are included under "Public Utility Facilities." Solar thermal systems are included under "Solar Thermal Energy Facilities." Solar electric facilities are a type of renewable energy facility and included under "Energy-Generating Facilities" and "Renewable Energy Facilities" as defined by this Title.

Solar Heating and Hot Water Systems. Solar energy systems that capture the sun's radiant energy, convert it into heat energy, store this heat in insulated storage tank(s), and deliver the stored energy as needed to either the domestic hot water or heating system for on-site uses. Solar heating and hot water systems are a type of renewable energy facility and included under "Energy-Generating Facilities" and "Renewable Energy Facilities" as defined by this Title.

Solar Thermal Energy Facilities. The components and subsystems that concentrate sunlight on a relatively small area to create high temperatures that vaporize water or other fluids to drive a turbine for generation of electric power. Solar thermal energy facilities are a type of renewable energy facility and included under "Energy-Generating Facilities" and "Renewable Energy Facilities" as defined by this Title.

SECTION 31: Section 22.80.030.W on page 8-77 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

Wind Energy Conversion Systems (WECS). Devices which converts wind energy to a form of usable energy or provide storage of wind energy including all equipment and accessory structures related to the system, including but not limited to wind turbines, mounting posts, on-site transmission lines, operations and maintenance buildings, and other related accessory structures. WECS producing electricity are included here; those used for direct climate control, water pumping, or other conversion to mechanical or thermal power, are included under "Agricultural Accessory Structures." Transmission lines located off the site of the facility are included under "Pipelines and Transmission Lines." Electrical substations are included under "Public Utility Facilities." (SIC: Group 49) (Amended 1989, Ord. 2411). WECS are a type of renewable energy facility and included under "Energy-Generating Facilities" and "Renewable Energy Facilities" as defined by this Title.

<u>SECTION 32</u>: Section 22.94.082.C starting on 9-56 (excluding Figure 94-39 which is not proposed for change) of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

C) Commercial Retail (CR) - Stockdale Road area.

The following standards apply within the Commercial Retail land use category on Stockdale Road, as shown in Figure 94-39.

1) Limitation on use. Land uses shall be limited to the following

Animal keeping Offices, temporary

Bars and night clubs (limited to 60 customer Outdoor sports and recreation

seats)

Caretaker residence Pipelines and transmission lines

Convenience and liquor stores (limited to 2,000 Public safety facilities

square feet)

Crop production and grazing

Public utility facilities

Energy-generating facilities (limited to renewable energy facilities)

Recycling collection stations

Food and beverage products manufacturing Residential accessory uses

General retail (limited to 2,000 square feet)

Restaurants (limited to 60 customer

seats)

Grocery stores (limited to 1,500 square feet)

Small scale manufacturing

Mail order and vending Vehicle storage

2) Permit Requirement. Minor Use Permit approval is required for any new use and any expanded use that increases use area more than 10 percent, unless a Conditional Use Permit is otherwise required by this Title.

SECTION 33: Section 22.94.082.D, starting on page 9-57 (excluding Figures 94-40 and 94-41) which is not proposed for change) of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

- D) Commercial Service (CS) Wellsona Road area. The following standards apply within the Commercial Service category from the vicinity of the intersection of Highway 101 and Wellsona Road to the Exline Road intersection with the highway, as shown in Figure 94-40.
  - 1) Limitation on use Wellsona Road area. Allowable land uses on the Wellsona Road properties shown in Figure 94-40 are limited to:

Agriculture and accessory structures Recreational Vehicle Parks

Bars and night clubs Recycling and scrap

Bed and breakfast inns Recycling collection stations
Caretaker residence Residential accessory use

Concrete, gypsum, and plaster products

Restaurants

Construction contractors

Small scale manufacturing

Convenience and liquor stores (limited to 2,000 Stone and cut stone products

square feet)

Crop production and grazing

Storage, accessory

Energy-generating facilities (limited to renewable Storage yards

energy facilities)

Existing motorcycle dealers Temporary offices Gas stations Transmission facilities

General retail (limited to gifts, novelties, souvenirs, Truck stops

and antiques)

Grocery stores (maximum gross floor area of 5,000

square feet)

Vehicle and freight terminals

Hotels, motels if associated with truck stops as uses Vehicle storage Mail order and vending Warehousing

Personal services Wholesale and distribution

Public safety facilities

2) Limitation on use - Other Commercial Service properties. Land uses shall be limited to the following for other Commercial Service properties shown in Figure 94-40. Retail sales are limited only to the incidental sale of goods produced, assembled or manufactured on the site. All other sales shall be wholesale to other businesses only.

Ag accessory structures Recreational vehicle parks are also an allowable

use on a property at Exline and Stockdale Roads,

as shown in Figure 94-41.

Caretaker residence Small scale manufacturing Concrete, gypsum, and plaster products Stone and cut stone products

Construction contractors Storage, accessory Crop production and grazing Storage yards Energy-generating facilities (limited to Temporary offices

renewable energy facilities)

Existing motorcycle dealers Transmission facilities

Public safety facilities Vehicle and freight terminals

Recycling and scrap Vehicle storage Recycling collection stations Warehousing

Wholesale and distribution Residential accessory use

3) Permit requirement. Minor Use Permit approval is required for all new uses, or expanded uses that increase use area more than 10 percent, unless a Conditional Use Permit is otherwise required by this Title.

SECTION 34: Section 22.94.082.E on page 9-65 (excluding Figure 94-48 which is not proposed for change) of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

- E) Industrial (IND). The following standards apply within the Industrial land use category located at Wellsona Road east of Highway 101 as shown in Figure 94-48.
  - 1) Limitation on use. Land uses shall be limited to fuel dealers, energy-generating facilities (limited to renewable energy facilities), and those listed in Table 2-2, Section 22.06.030 within the Manufacturing and Processing group as allowable, permitted, or conditional

- in the Industrial land use category. Retail trade uses are only allowed incidental to the manufacture, assembly or processing of products on the same site.
- 2) Permit requirement. Minor Use Permit approval is required for all proposed uses, unless a Conditional Use Permit is otherwise required by this Title.

<u>SECTION 35</u>: Section 22.94.082.G.4 starting on page 9-68(excluding Figures 94-53 which is not proposed for change) of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

- 4) Spanish Camp Area. The following standards apply only to the area south of Charolais Road, east of Highway 101, as shown in Figure 94-53.
  - a) Limitation on use Spanish Camp area. Land uses shall be limited to the following, in compliance with the land use permit requirements of Section 22.06.030: agricultural accessory structures; crop production and grazing; caretaker residence; animal keeping; energy-generating facilities (limited to renewable energy facilities); home occupations; residential accessory uses; single-family dwellings; storage-accessory; and temporary construction yards.

SECTION 36: Section 22.94.082.G.5 starting on page 9-69(excluding Figure 94-54, which is not proposed for change) of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

5) Almira Park area. Allowable land uses within the Almira Park area as shown in Figure 94-54 are limited to agricultural accessory structures; crop production and grazing; caretaker residences; animal keeping; energy-generating facilities (limited to renewable energy facilities); home occupations; residential accessory uses; single-family dwellings; storage-accessory; temporary construction yards; and bed and breakfast inns.

SECTION 37: Section 22.94.090.C starting on page 9-78 (excluding Figure 94-65, which is not proposed for change) of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

- C) Commercial Service (CS). The following standards apply within the Commercial Service land use category.
  - 1) **Highway 46 between Shandon and Cholame Commercial Service area**. The following standards apply to the area located on the northwest side of Highway 46 between Shandon and Cholame, which is 200 feet wide with 390 feet of frontage on Highway 46 extending southwesterly from the intersection of the highway and the easterly line of the northwest quarter of Section 2, Township 26 South, Range 15 East as shown on Figure 94-65.
    - a) Limitation on use service commercial area. Land uses shall be limited to the following, subject to the land use permit requirements of Section 22.06.030: Metal Industries Fabricated; Small Scale Manufacturing; Agricultural Processing (excluding wine tasting and special events); Energy-Generating Facilities (limited to Accessory Renewable Energy Facilities that are an accessory use); Warehousing (no wholesale or retail sales from the site), Caretaker's Quarters and Residential

Accessory Uses. All uses are limited to the producing, assembling, manufacturing, and storing of goods and products that are for rural or agricultural applications or operations

- b) **Permit requirement**. Minor Use Permit approval is required for all new or expanded uses, unless a Conditional Use Permit is otherwise required by this Title.
- 2) West Centre and Highway 46. The following standards apply to the property near the intersection of West Centre Street and State Highway 46. Figure 94-66
  - a) Permit requirement. Conditional Use Permit is required prior to the first entitlement on the site. The Conditional Use Permit shall specify the permit requirements for the full build-out of the site for all new construction. If a separate entitlement has not been obtained prior to the master Conditional Use Permit for the Peck Ranch Master Plan area required by Section 22.110.050.B.1, development of this site shall be included as part of that master Conditional Use Permit.
  - b) b) Limitation on use. Allowable uses shall be limited to Ag Processing, Animal hospitals and veterinary medical facilities, Crop Production and Grazing, Nursery Specialties, Small Scale Manufacturing (limited to artisan/craftsman type operations), Indoor Amusement and Recreation Facilities, Energy-Generating Facilities (limited to Accessory Renewable Energy Facilities), Automobile Service Stations and Gas Stations, Restaurants, Libraries and Museums, Outdoor Sports and Recreational Facilities, Public Assembly and Entertainment Facilities, General Retail, Restaurants, Lodging and Personal Services.

3)

SECTION 38: Section 22.96.050.A starting on page 9-94 (excluding Figure 96-8, which is not proposed for change) of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

- **A.** Agriculture (AG). The following standards apply within the Agriculture land use category.
  - 1. O'Connor Way / West Foothill Area. The following standards apply to development projects that are accepted as complete for processing after September 20, 2002 and only to lands within the Agriculture land use category in the O'Connor Way / West Foothill Area, as shown in Figure 108-10.

Guideline: Development should be designed to blend with the existing rural development and preserve the rural and agrarian character of the area.

a. Limitation on Use. Uses identified in Table O, Part I of the Land Use Element as "A" or "S" uses are limited to: agricultural accessory structures; agricultural processing; airfields and landing strips; animal raising and keeping; bed and breakfast facilities; caretaker residence; churches; communications facilities; crop production and grazing; eating and drinking places; energy-generating facilities electric generating plants (solar energy electric facilities and wind energy conversion systems & WECF only); farm equipment and supplies; farm support quarters; fisheries and game preserves; food and kindred products; forestry; home occupations; libraries and museums; membership organization facilities; mining; mobilehomes; nursery specialties; offices, temporary; outdoor retail sales; petroleum extraction; pipelines

and transmission lines; public safety facilities; public utility facilities; residential accessory uses; residential care (for 6 or fewer); roadside stands; rural recreation and camping; schools- specialized education and training; single family dwellings; small scale manufacturing; specialized animal facilities; storage accessory; temporary construction trailer parks; temporary construction yards; temporary dwelling; temporary events; warehousing; and wholesaling and distribution.

SECTION 39: Section 22.96.050.B starting on page 9-94 (excluding Figure 96-9, which is not proposed for change) of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

- B) Rural Lands (RL). The following standards apply within the Rural Lands land use category.
  - 1) Irish Hills Limitation on use. Land uses within the Irish Hills (see Figure 96-9) shall be limited to the following, in compliance with the land use permit requirements of Section 22.06.030: ag accessory structures; animal facilities; crop production and grazing; nursery specialties; energy-generating facilities (limited to renewable energy facilities); communications facilities; animal keeping; residential accessory uses; single-family dwellings; mobile homes; temporary dwellings; roadside stands; outdoor retail sales; accessory storage; pipelines and transmission lines.
  - 2) San Luis Obispo Sub-area Limitation on use. All land uses identified by Section 22.06.030 as allowable, permitted, or conditional in the Rural Lands land use category within the San Luis Obispo Sub-area (as shown in Figure 96-1) may be authorized in compliance with the land use permit requirements of that Section, except residential care, correctional institutions, and uses listed by Table 2-2, Section 22.06.030 in the Industry, Manufacturing and Processing use group.
- C) Industrial (IND) Edna and Buckley Roads Limitation on use. Land uses on the shaded parcel within the Industrial land use category shown in Figure 96-10 shall be limited to construction contractors, caretaker residences, and storage yard (sales lots prohibited), and energy-generating facilities (limited to accessory renewable energy facilities).

<u>SECTION 40</u>: Section 22.96.050.E.2 starting on page 9-96 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

a) Limitation on Use. Uses identified in Table O, Part I of the Land Use Element as "A" or "S" uses are limited to: agricultural accessory structures; animal raising and keeping; bed and breakfast facilities; caretaker residence; cemeteries and columbaria; churches; communications facilities; crop production and grazing; energy-generating facilities; electric generating plants (solar electric facilities and wind energy conversion systems solar and WECF only); farm equipment and supplies; fisheries and game preserves; forestry; home occupations; mobile homes; nursery specialties; offices, temporary; public safety facilities; public utility facilities; residential accessory uses; residential care (for 6 or fewer); roadside stands; secondary dwellings; single family dwellings; specialized animal facilities; storage accessory; temporary dwelling;

and existing school, pre to secondary, and existing outdoor sports and recreation facilities.

<u>SECTION 41</u>: Section 22.96.050.E.3 starting on page 9-96 (excluding Figure 96-11, which is not proposed for change) of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

3) West of Bear Valley Estates (Tract 502). The following standards apply only to the parcel located west of Tract 502 as shown in Figure 96-11.

Limitation on use. Land uses shall be limited to agricultural accessory structures, animal keeping, and crop production and grazing, and energy-generating facilities (limited to renewable energy facilities).

<u>SECTION 42</u>: Section 22.96.050.F.3 starting on page 9-104 (excluding Figure 96-17, which is not proposed for change) of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

- 3) Squire Canyon. The following standards apply to the Residential Suburban land use category in Squire Canyon (see Figure 96-17).
  - a) Limitation on use. Land uses in the area northeast of the intersection of Squire Canyon and Indian Knob roads shall be limited to the following (as required by Ordinance 824): agricultural accessory structures; crop production and grazing; energy-generating facilities (limited to renewable energy facilities); communications facilities; animal keeping; animal facilities (with the only use limited to keeping not more than six adult dogs per parcel, with a kennel license being required for raising more than four adult dogs, in compliance with County Code Section 9.04.120); home occupations; residential accessory uses; single-family dwellings; temporary dwellings; pipelines and transmission lines.

<u>SECTION 43</u>: Section 22.98.062.B.3.c starting on page 9-156 (excluding Figure 98-12, which is not proposed for change) of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

c) Limitation on use. Land uses shall be limited to the following, in compliance with the land use permit requirements of Section 22.06.030: agricultural accessory structures; animal keeping; crop production and grazing; animal facilities (horse ranches and other equestrian facilities only); energy-generating facilities (limited to renewable energy facilities); caretaker residences; home occupations; mobile homes; residential accessory uses; single-family dwellings; storage, accessory; and public utility facilities. Notwithstanding the provisions of this standard, it is the applicant's responsibility to ensure that any proposed land uses comply with the Tiffany Ranch covenants, conditions and restrictions (CC&Rs).

SECTION 44: Section 22.98.072.A.3.a starting on page 9-172 (excluding Figure 98-22, which is not proposed for change) of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

a) Limitation on use. Land uses are limited to the following within the Agriculture land use category in the Nipomo and Santa Maria (Oso Flaco) Valleys, subject to the land use permit requirements of Section 22.06.030:

Ag processing Mobile homes

required)

Animal keeping Outdoor retail sales

Communications facilities Pipelines and power transmission lines

Crop production and grazing Residential accessory uses

Energy-generating facilities (limited to accessory renewable energy facilities)

Roadside stands

Farm support quarters

Home occupations Single-fan

Mining and concrete batch plants (within the area along the Santa Maria River

shown in Figure 98-23 which corresponds to the EX1 or subsequently designated EX combining designation)

Single-family dwellings Temporary dwellings

SECTION 45: Section 22.98.072.F.1.a starting on page 9-181 (excluding Figure 98-30, which is not proposed for change) of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

- F) Recreation (REC)/Public Facilities (PF). The following standards apply within the Recreation/Public Facilities land use category in the rural portions of the South County planning area.
  - 1) Northwest corner of Willow and Via Concha. The following standards apply only to the property shown as Area B in Figure 98-30.
    - a) Limitation on Use.
      - (1) Land uses within the REC/ PF land use category shall be limited to: Schools Elementary and Secondary, and energy-generating facilities (limited to accessory renewable energy facilities), if the site is acquired and developed by the Lucia Mar Unified School District.
  - (2) Land uses within the REC/ PF land use category shall be limited to Crop Production and Grazing, Outdoor Sports and Recreation, Energy-generating facilities (limited to renewable energy facilities), Parks, and active and passive Open Space if the site is not acquired and developed by the Lucia Mar Unified School District.

<u>SECTION 46</u>: Section 22.104.030.C -starting on page 10-12 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

- C) Open Space (OS). The following standards apply within the OS land use category.
  - 1) Limitation on use. Land uses shall be limited to: a single shooting range, equestrian facilities and incidental camping, hiking and riding trails, picnic areas; grazing and other agricultural uses; energy-generating facilities (limited to renewable energy facilities); public utility facilities; communication facilities; and pipelines and transmission lines, in compliance with the land use permit requirements of Section 22.06.030.
  - 2) Limitation on use Open space lots. Use of the open space lots in Tracts 424, 446, 447, 452, 466, 474, and 475 shall be limited to hiking and riding trails, energy-generating facilities (limited to renewable energy facilities), and approved facilities for recreational, drainage, and utility purposes. These lots shall be retained in permanent open space. Open space lots in future subdivisions shall be subject to this Limitation on use.

<u>SECTION 47</u>: Section 22.104.030.E- starting on page 10-13 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

- E) Residential Rural (RR). The following standards apply within the RR land use category.
  - 1) Limitation on use. Land uses shall be limited to single-family dwellings, residential accessory uses, home occupations, animal keeping and agricultural uses, and energy-generating facilities (limited to renewable energy facilities) in compliance with the land use permit requirements of Section 22.06.030.

<u>SECTION 48</u>: Section 22.104.030.F.2 starting on page 10-14 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

2) Limitation on use - Open space lots. Use of the open space lots in new land divisions shall be limited to agricultural uses, energy-generating facilities (limited to renewable energy facilities—that are an accessory use), biking and riding trails, and approved facilities for recreation, drainage and utility purposes. These lots shall be retained in permanent open space use.

SECTION 49: Section 22.104.030.G.1 starting on page 10-14 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

1) **Limitation on use.** Land uses shall be limited to single-family dwellings, residential accessory uses, home occupations, animal keeping and agricultural uses, <u>and energy-generating facilities (limited to accessory renewable energy facilities that are an accessory use), in compliance with the land use permit requirements of Section 22.06.030.</u>

<u>SECTION 50</u>: Section 22.104.040.C.1 starting on page 10-19 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

1) **Limitation on use**. Land uses within areas designated for open space shall be limited to riding and hiking trails, energy-generating facilities (limited to renewable energy facilities), and utilities, in compliance with the land use permit requirements of Section 22.06.030.

SECTION 51: Section 22.104.040.F.1 starting on page 10-20 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

1) Limitation on use. Land uses shall be limited to single-family dwellings, residential accessory uses, home occupations, and religious facilities, and energy-generating facilities (limited to renewable energy facilities that are an accessory use), in compliance with the land use permit requirements of Section 22.06.030.

SECTION 52: Section 22.104.050.B.1 starting on page 10-22 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

- B) Commercial Retail (CR). The following standards apply within the CR land use category.
  - 1. Limitation on use. Land uses shall be limited to bars and night clubs, convenience and liquor stores, single-family dwellings, gas stations, general retail, grocery stores, and restaurants, and energy-generating facilities (limited to accessory renewable energy facilities that are an accessory use, in compliance with the land use permit requirements of Subsection B.2.

SECTION 53: Section 22.104.050.C on page 10-23 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

C) Residential Suburban (RS) - Limitation on use. Land uses within the RS land use category shall be limited to single-family dwellings, and religious facilities, and energygenerating facilities (limited to renewable energy facilities that are an accessory use), in compliance with the land use permit requirements of Section 22.06.030.

SECTION 54: Section 22.104.060.B.3.a on page 10-26 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

1. Location and Limitation on use. Land uses shall be limited to:

Energy-generating facilities (limited to renewable energy facilities)

Accessory storage

Bars and night clubs

Convenience and liquor stores

Gas stations

Grocery stores, and general retail (tourist oriented, limited to 2,000 square feet each, to total no more than 30,000 square feet in areas 1 and 2)

Hotels and motels

Outdoor retail sales (plaza festivals and art

shows)

Personal services

Recreational vehicle park (on the southerly

half of the site)

Restaurants

Small scale manufacturing

<u>SECTION 55</u>: Section 22.104.060.D-E on page 10-27 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

- D) Industrial (IND) Limitation on use. Land uses within the Industrial land use category shall be limited to: offices; accessory storage; storage yards; vehicle and freight terminals; and warehousing; and energy-generating facilities (limited to renewable energy facilities).
- E) Recreation (REC) East of Mission Street Limitation on use. Land uses in the area within the Recreation land use category located east of Mission Street as shown in Figure 104-4 shall be limited to religious facilities, libraries and museums, outdoor sports and recreation, energy-generating facilities (limited to accessory renewable energy facilities—that are an accessory use), temporary events, or other similar uses that can be found compatible and consistent with the existing cultural resources, in compliance with the land use permit requirements of Section 22.06.030.

<u>SECTION 56</u>: Section 22.104.070.C-D on page 10-35 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

- C) **Industrial (IND).** The following standards apply within the Industrial land use category.
  - 1) **Limitation on Use Railroad property.** Allowable land uses are limited on lands in Southern Pacific Railroad ownership to offices, accessory storage, storage yards, vehicle and freight terminals, pipelines and transmission, public utility facilities and warehousing; and energy-generating facilities (limited to renewable energy facilities).
- D) **Recreation (REC).** The following standards apply within the Recreation land use category.
  - 1) **Limitation on use.** Land uses shall be limited to libraries and museums, membership organization facilities, outdoor sports and recreation, public assembly and entertainment, sports assembly, temporary events, government offices and caretaker residences, and energy-generating facilities (limited to accessory renewable energy facilities—that are an accessory use).

<u>SECTION 57</u>: Section 22.104.080.A.5.a on page 10-38 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

5. Energy and water conservation. New development shall implement the following water and energy-saving measures: Installation of low flow or dual flush toilets, low flow shower heads and water faucets and energy efficient appliances; drip irrigation or micro-sprayers on appropriate landscaped areas; Use of devices such as soil monitors and rain shutoff devices for all automatic irrigation systems; and use of mulch in non-turf areas, permeable hardscape to the extent feasible, soil amendments to increase soil moisture holding capacity of soil and native low water using landscaping.

In addition, new development shall include at least four of the following conservation techniques:

a. Install <u>renewable energy facilities or alternative</u> energy equipment and devices such as solar <u>heating</u> and hot water <u>systems</u> thermal heating.

<u>SECTION 58</u>: Section 22.104.080.E.2 on page 10-53 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

2) Limitation on use. Land uses shall be limited to the those in the following use groups: Industry, Manufacturing and Processing, excluding concrete, gypsum and plaster products, recycling - scrap and dismantling yards, and stone and cut stone products; Recreation, Education & Public Assembly, excluding outdoor sports and recreation facilities and sports assembly; Services (includes offices); Retail Trade-limited to uses that are in support of the business park; and Agriculture, Resource, and Open Space-limited to agricultural processing and nursery specialties and energy-generating facilities (limited to accessory renewable energy facilities that are an accessory use) only.

SECTION 59: Section 22.104.080.F.1 on page 10-54 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

1) Limitation on use. Allowable uses shall be limited to Ag Processing, Energy-Generating Facilities (limited to Renewable Energy Facilities only), Animal hospitals and veterinary medical facilities, crop production and grazing, nursery specialties, Small Scale Manufacturing (limited to artisan and craftsman-type operations), Indoor Amusement and Recreation Facilities, Outdoor Sports and Recreational Facilities, Public Assembly and Entertainment Facilities, Automobile Service Stations/Gas Stations, General Retail, Restaurants, and Lodging, and Personal Services.

<u>SECTION 60</u>: Section 22.104.080.G on page 10-55 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

G) Recreation (REC) - Limitation on use. Within the Recreation land use category, uses are limited to: Crop Production and Grazing, Energy-Generating Facilities (limited to Renewable Energy Facilities only), Recycling - Collection Stations, Libraries and Museums, Outdoor Sports and Recreational Facilities, Public Assembly and Entertainment Facilities, Sports Assembly, Temporary Events, and Outdoor Retail Sales. Areas adjacent to Crawford W. Clarke Memorial Park are limited to the expansion of the community park.

<u>SECTION 61</u>: Section 22.104.090.D.3 on page 10-63 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

a. **Limitation on use.** Allowable land uses shall be limited to Building Materials and Hardware and incidental outdoor storage, Nursery Specialties, <u>Energy-Generating Facilities (limited to Renewable Energy Facilities that are an accessory use)</u>, and Vehicle and Freight Terminals.

SECTION 62: Section 22.104.090.D.4.a on page 10-64 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

a. **Limitation on use.** Land uses shall be limited to agricultural processing, agricultural accessory structures, caretaker residence, crop production and grazing, energy-generating facilities (limited to renewable energy facilities that are an accessory use), incidental offices, accessory storage, outdoor storage yards, and vehicle and freight terminals.

<u>SECTION 63</u>: Section 22.104.090.F.3 on page 10-65 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

3. **Limitation on use - Railroad property.** Allowable land uses are limited to: offices; accessory storage; storage yards; vehicle and freight terminals; and warehousing; and energy-generating facilities (limited to renewable energy facilities—that are an accessory use).

<u>SECTION 64</u>: Section 22.104.090.G.2.a on page 10-66 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

a. **Limitation on use.** Land uses shall be limited to libraries and museums, outdoor sports and recreation, and public assembly and entertainment, and energy-generating facilities (limited to accessory renewable energy facilities—that are an accessory use) in compliance with the land use permit requirements of Section 22.06.030.

<u>SECTION 65</u>: Section 22.104.090.G.3.c on page 10-67 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

c. Limitation on use. Land uses shall be limited to indoor amusement and recreation facilities, libraries and museums, outdoor athletic facilities, public parks and play-grounds, schools, sports assembly, temporary events, health care services, social service organizations, caretaker quarters, offices, public assembly and entertainment facilities, and transit stations and terminals, and energy-generating facilities (limited to renewable energy facilities), in compliance with the land use permit requirements of Section 22.06.030.

<u>SECTION 66</u>: Section 22.104.090.G.4.b on page 10-69 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

b. **Limitation on use.** Land uses shall be limited to indoor amusement and recreation facilities, libraries and museums, outdoor athletic facilities, public parks and playgrounds, schools, sports assembly, temporary events, health care services, social service organizations, caretaker quarters, offices, public assembly and entertainment facilities and transit stations and terminals, and energy-generating facilities (limited to renewable energy facilities), in compliance with the land use permit requirements of Section 22.06.030.

<u>SECTION 67</u>: Section 22.106.010.C on page 10-79 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

C) Commercial Retail (CR). The following standards apply within the Commercial Retail land use category.

- 1) Avila Valley. The following standards apply only to Avila Valley (see Figure 106-1), to the specific areas listed.
  - a) Limitation on use. Land uses shall be limited to highway and tourist oriented uses and energy-generating facilities (limited to accessory renewable energy facilities that are an accessory use).
  - b) Permit requirement. Conditional Use Permit approval is required for all uses.
  - c) Access Commercial site at San Luis Bay Drive and Highway 101. Primary access to the commercial site shall be from San Luis Bay Drive.
- 2) **San Luis Bay Estates.** The following standards apply only to the San Luis Bay Estates (see Figure 106-2), to the specific areas listed.
  - a) Limitation on use. Land uses in the commercial village shall be limited to bars and night clubs, convenience and liquor stores, financial services, general retail, grocery stores, health care services, offices, personal services, public assembly and entertainment, and restaurants, and energy-generating facilities (limited to accessory renewable energy facilities—that are an accessory use).

<u>SECTION 68</u>: Section 22.106.010.E.2 on page 10-82 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

- 2. **San Luis Bay Estates.** The following standards apply only to the San Luis Bay Estates (see Figure 106-2), to the specific areas listed.
  - a) Limitation on use. Land uses shall be limited to the following, in compliance with the land use permit requirements of Section 22.06.030: accessory storage; bars and night clubs; caretaker residence; convenience and liquor stores; grocery stores; hotels and motels; indoor amusements and recreation; outdoor sports and recreation; pipelines and transmission lines; public safety facilities; restaurants; rural recreation and camping; temporary events, and energy-generating facilities (limited to accessory renewable energy facilities—that are an accessory use).

<u>SECTION 69</u>: Section 22.106.010.F.2 on page 10-85 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

- 2. **San Luis Bay Estates.** The following standards apply only to the San Luis Bay Estates (see Figure 106-2), to the specific areas listed.
  - a) **Limitation on use.** Land uses within the residential clusters shall be limited to: home occupations; residential accessory uses; single-family dwellings; temporary dwellings; public safety facilities; public utility facilities; pipelines and transmission lines and storage accessory, and energy-generating facilities (limited to renewable energy facilities—that are an accessory use). The range of uses allowed shall be further refined through preparation

of the project Master Use Permit, so that uses will be compatible with the character of each cluster.

SECTION 70: Section 22.108.040.C.3.a on page 10-97 (excluding Figure 108-11, which is not proposed for change) of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

a. **Limitation on use**. Land uses shall limited to the following, in compliance with the land use permit requirements of Section 22.06.030: grocery stores; restaurants; offices; financial services; personal services; consumer repair services; general retail; building materials and hardware; indoor amusements and recreation; gas stations; and multi-family or caretaker dwellings, and energy-generating facilities (limited to accessory renewable energy facilities), except that gas stations shall not be allowed within Area "A" on Figure 108-11.

SECTION 71: Section 22.108.050.F on page 10-119 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

F. **Recreation (REC) - Limitation on use.** Land uses within the Recreation land use category between Highway 1 and the railroad right-of-way shall be limited to recreational vehicle parks in compliance with Ordinance 1215, and energy-generating facilities (limited to accessory renewable energy facilities—that are an accessory use).

SECTION 72: Section 22.108.050.H.3.a on page 10-121 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

a. Limitation on use. Land uses shall be limited to the following, in compliance with the land use permit requirements of Section 22.06.030: mobile home parks; except that on 1989 Assessor Parcel Number 75-032-05 as shown in Figure 108-23, land uses shall be limited to: animal keeping; crop production and grazing; energy-generating facilities (limited to renewable energy facilities); religious facilities; membership organization facilities; home occupations; one single-family dwelling or mobile home; residential accessory uses; public safety facilities; storage, accessory; pipelines and transmission lines; and public utility facilities.

<u>SECTION 73</u>: Section 22.108.060.B.1 on page 10-1223 of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

1. **Limitation on use.** Land uses shall be limited to: bars and night clubs; caretaker dwellings; consumer repair services; convenience and liquor stores; financial services; gas stations; general retail; hardware stores; indoor amusements and recreation; offices; personal services; restaurants, and energy-generating facilities (limited to accessory renewable energy facilities-that are an accessory use).

SECTION 74: Section 22.108.060.C.1 on page 10-125 97 (excluding Figure 108-26, which is not proposed for change)of the Land Use Ordinance, Title 22 of the San Luis Obispo County Code, is hereby amended to read as follows:

1. Limitation on Use. The allowed uses are as follows:

- a. "previously-approved uses" per D890413D are allowed, including: golf course and related uses, specific commercial uses within the "Village Center", single family residences, eating and drinking places;
- b. additional uses as follows: hotel (not to exceed 103-units), a facility of an approximate 14, 000 square foot footprint (pro-shop, hotel registration, and full service restaurant (200 seat)), employee housing, additional "Village Center" use to allow general public to conduct meetings and social events, and child care facilities, and energy-generating facilities (limited to accessory renewable energy facilities that are an accessory use).

SECTION 75: Based on the findings attached hereto as Exhibit LRP2014-00015:C<sup>1</sup> and incorporated herein as if set forth in full, the Board of Supervisors hereby certifies that the FEIR has been prepared and completed in compliance with the California Environmental Quality Act, California Public Resources Code Section 21000 et seq., that the Board of Supervisors reviewed and considered the information contained in the FEIR and the information submitted prior to and during public hearings on the project prior to approving the amendments, and that the FEIR reflects the lead agency's independent judgement and analysis.

SECTION 76: If any section, subsection, clause, phrase or portion of this ordinance is for any reason held to be invalid or unconstitutional by the decision of a court of competent jurisdiction, such decision shall not affect the validity or constitutionality of the remaining portion of this ordinance. The Board of Supervisors hereby declares that it would have passed this ordinance and each section, subsection, clause, phrase or portion thereof irrespective of the fact that any one or more sections, subsections, sentences, clauses, phrases or portions be declared invalid or unconstitutional.

SECTION 77: This ordinance shall take effect and be in full force on and after 30 days from the date of its passage hereof. Before the expiration of 15 days after the adoption of this ordinance, it shall be published once in a newspaper of general circulation published in the County of San Luis Obispo, State of California, together with the names of the members of the Board of Supervisors voting for and against the ordinance.

<u>SECTION 78</u>: In accordance with Government Code Section 25131, after reading of the title of the ordinance, further reading of the ordinance in full is waived.

<sup>&</sup>lt;sup>1</sup> The Findings will be provided as an attachment to the staff report when the RESP is presented to the Planning Commission and Board of Supervisors as part of a public hearing.

# Proposed Amendments County of San Luis Obispo Rules of Procedure to Implement the California Land Conservation Act of 1965

Renewable Energy Streamlining Program
Public Review Draft

November 2014

#### **SECTION 1:** Table 2 of the Rules of Procedure, is amended to read as follows:

Add a new Use Group entitled "Renewable Energy Facilities".

		Coastal Zone	
USE GROUP	INLAND AREA	PRIME SOILS	NON-PRIME SOILS
Renewable Energy	Appendix 1	No	No
<u>Facilities</u>			

#### **SECTION 2**: Appendix to the Rules of Procedure, are amended as follows:

#### Add Appendix 6 to the Ag Preserve Rules of Procedure:

Tier 2 through 4 REF projects are allowed on contracted land if they can satisfy the following criteria:

- 1. These criteria apply to Renewable Energy Facilities only, not "Non-Renewable Energy Facilities" as defined in Title 22 which are not allowed uses on contracted land.
- 2. Each property must meet and maintain the current eligibility criteria in the Rules of Procedure for both establishment of an agricultural preserve and entering into a land conservation contract as well as the "Minimum Parcel Size for Conveyance" required by each contract. A land owner with a contract not compliant with current eligibility standards may apply to requalify their property and enter into a new replacement contract as part of the application process for a REF project.
- 3. The site area acreage for the REF shall not be located on areas of the property/parent parcel with soils types necessary to qualify for establishment of an agricultural preserve and entering into a land conservation contract.
- 4. An REF project must not involve removal of existing cultivated areas of the property unless the same or equal value crops are planted on equal quality soils. (There shall be no net decrease in the amount of cultivated land associated with the REF project).
- 5. An REF project may not be located on prime or potentially prime soils. (Any soils classified as Class 1 if irrigated or Class 2 if irrigated by the Natural Resource Conservation Service soils survey).
- 6. REF projects are not allowed on properties qualifying for preserves and contracts as High Productivity Prime Land (Small specialized Farms)
- 7. For properties qualifying as a Prime Land Preserves the site area acreage for REF projects shall be in addition to the minimum acreage required to meet the 40 acre eligibility criteria. (Example: An REF project on prime land preserve property must exceed 40 acres by the amount of the REF site acreage).

- 8. For properties qualifying as a Mixed Use (irrigated non-irrigated use) shall be required to have acreage consistent with the 80 to 160 acre minimum parcel size based on eligible soils classes and uses. The acreage required for the REF site shall be in addition to the applicable minimum parcel size.
- 9. For properties qualifying as Dry Land Preserves (non-irrigated Class 3 & 4 soils) minimum 160 acres in size with 100 acres of Class 3 & 4 qualifying soils and current or historical dry farm agricultural use) the acreage required for the REF site shall be in addition to minimum parcel size of 160 acres.
- 10. For properties qualifying as Rangeland Preserves (Class 6 & 7 or better soils and minimum 320 acres in size with 100 acres of Class 6 & 7 qualifying soils and 100 acres with soils moderately to well-suited as rangeland) the REF project site shall be in addition to the minimum parcel size of 320 acres.
- 11. REF project acreage may not exceed 20% of the total acreage within a land conservation contract.
- 12. <u>The proposed REF project must be found consistent with the Principles of Compatibility in the Williamson Act [Government Code Section 51238.1(a) et seq.].</u>
- 13. REF projects up to 20 acres in size may be reviewed by Department of Planning and Building staff for consistency with the Rules of Procedure and the Principles of Compatibility unless a discretionary use permit is required by Title 22, in which case the REF project shall be presented to the Agricultural Preserve Review Committee for a recommendation to the Review Authority. The Agricultural Preserve Review Committee shall base their review on the criteria in the Rules of Procedure and the Principles of Compatibility.
- 14. REF projects over 20 acres in size on contracted land shall require Minor Use Permits (or conditional use permits if otherwise required by Title 22) and shall be presented to the Agricultural Preserve Review Committee for a recommendation to the Review Authority for the use permit. The Agricultural Preserve Review Committee shall base their review on the criteria in the Rules of Procedure and the Principles of Compatibility.

# EXHIBIT LRP 2014-00015:E AMENDMENTS TO THE RULES OF PROCEDURE TO IMPLEMENT THE LAND CONSERVATION ACT OF 1965

### Amendments to Table 2 Agricultural and Compatible Uses for Lands Subject to Land Conservation Contracts and Farmland Security Zone Contracts

- The current USE GROUP "Electric Generation Plants" (renamed "Energy Generating Facilities" in the draft Renewable Energy Streamlining Program) to be retained as referenced in Table 2 not allowed on contracted land.
- Add a new USE GROUP entitled "Renewable Energy Facilities" allowed subject to the criteria in new Appendix E 6 on property under contract in the Inland area of the county.
- Add note 12 to Table 2 referencing proposed Land Use Ordinance Section 22.32.020.A.2 Accessory Renewable Energy-Generating Facilities. On-site use Renewable Energy Facilities are allowed on contracted land subject to Title 22.
- Add note 13 to Table 2 referencing Appendix E 6 Criteria for RESP

#### The criteria to be added to the Rules of Procedure as Appendix E 6 are as follows:

Renewable Energy Facility (REF) projects are allowed on contracted land if they can satisfy the following criteria:

- a) These criteria apply to Renewable Energy Facilities only, not "Non-Renewable Energy Facilities" ("Electric Generation Plants" renamed "Energy Generating Facilities" in the draft Renewable Energy Streamlining Program) as defined in Title 22 which are not allowed uses on contracted land.
- b) Each property must meet and maintain the current eligibility criteria in the Rules of Procedure for both establishment of an agricultural preserve and entering into a land conservation contract as well as the "Minimum Parcel Size for Conveyance" required by each contract. A land owner with a contract not compliant with current eligibility standards may apply to requalify their property and enter into a new replacement contract as part of the application process for a REF project.
- c) A REF project may not be located on prime or potentially prime soils. (Prime or potentially prime soils are any soils classified as Class 1 or Class 2 by the Natural Resource Conservation Service soils survey).
- d) REF projects are not allowed on properties qualifying for preserves and contracts as High Productivity Prime Land (Small specialized Farms).

- e) For properties qualifying as a Prime Land Preserve the site area acreage for REF projects shall be in addition to the minimum acreage required to meet the 40 acre eligibility criteria. (A REF project on prime land preserve property must exceed 40 acres by the amount of the REF site acreage).
- f) For properties qualifying as Mixed Use (irrigated and non-irrigated uses) the required acreage shall be consistent with the 80 to 160 acre minimum parcel size based on eligible soils classes and uses. The acreage required for the REF site shall be in addition to the applicable minimum parcel size.
- g) For properties qualifying as Dry Land Preserves (non-irrigated Class 3 & 4 soils, minimum 160 acres in size with 100 acres of Class 3 & 4 qualifying soils and current or historical dry farm agricultural use) the acreage required for the REF site shall be in addition to minimum parcel size of 160 acres.
- h) For properties qualifying as Rangeland Preserves (Class 6 & 7 or better soils and minimum 320 acres in size with 100 acres of Class 6 & 7 qualifying soils and 100 acres with soils moderately to well-suited as rangeland) the REF project site shall be in addition to the minimum parcel size of 320 acres.
- i) REF project site acreage may not exceed 10% of the total acreage of the property under a land conservation contract up to but not to exceed 20 acres in size.
- j) The proposed REF project must be found consistent with the Principles of Compatibility in the Williamson Act [Government Code Section 51238.1(a) et seq.].
- k) All REF projects shall be reviewed by Department of Planning and Building staff through Site Plan application for projects up to 10 acres in site area and Minor Use Permit for projects over 10 acres in site area. All REF projects shall be reviewed for compliance with the above criteria. REF projects subject to Minor Use Permit review (or Conditional Use Permit if otherwise required) shall be presented to the Agricultural Preserve Review Committee for a recommendation to the Review Authority. The Agricultural Preserve Review Committee shall base their review on the criteria in the Rules of Procedure and the Principles of Compatibility.
